Double Floor Beams 8 x 14
Iron Pintle Cap and Base
cast in one piece

SECTION OF SLOW BURNING MILL.

In view of the difficulties which have frequently occurred in preserving basement floors of the ordinary timber construction for lack of suitable ventilation underneath, and also in view of the rapid decay of timber and plank floors in bleacheries, dye works, print works and the like, where they quickly become saturated with moisture, reference may be made to the Guastavino cohesive tile construction, of which the representatives may be found at the offices of the Guastavino Fire-Proof Construction Company, in New York and Boston. It is claimed that on this method an indestructible floor can be laid near the ground, either in the original construction of the factory or works, or in substitution for a floor already decayed, at a very moderate cost. This mode of constructing floors may be observed in the interior construction of the Boston Public Library. We cannot give reference to any examples of this kind of floor in industrial works in this country. Reference will be made by the Guastavino Company to factories and works which have been constructed in Spain on this method.

We again repeat the following caution: Wherever and whenever solid beams or heavy timbers are made use of in the construction of a factory or a warehouse they should not be painted, varnished, oiled, filled or incased in impervious concrete, air-proof plastering, or metal for at least three years, lest fermentation should destroy them by what is called dry rot.

If the mill is to be heated by conveying steam through pipes, such pipes should be hung overhead. If the modern method, which is probably the best method, of conveying the heat through ducts in the pilastered walls should be adopted, provision will be made thereto in the construction of the mill wall.

The project of laying a telegraph line from Canada to Australia is at present under consideration.

NOVEL HYDRAULIC ENGINEERING.

The conversion of a pond of stagnant and offensive water into an agitated salt-water lake, was recently accomplished in an interesting manner, by James J. Powers, of Jamaica, L. I.

The scene of Mr. Powers' operations was at Princess Anne, Va., at what is known as Virginia Beach, just south of Cape Henry. At that point there is a sheet of water having an area of from 350 to 400 acres, known as Lake Holly, and in its immediate vicinity is the Princess Anne Hotel. The lake, which is about 3 feet above sea level at high water, was unsightly, and in seasons of drought evaporation would leave a muddy border. The question was, how to mitigate the annoyance. To draw the water off did not seem practicable. Mr. Powers was appealed to in the hope that he would devise some means of relief. The lake is situated about a quarter of a mile from the sea, and has an outlet through Linkhorn Creek into Linnhaven Bay. Holly Lake has a support of clay, and the space between the lake and the ocean, about a quarter of a mile, as stated, is largely made up of hills and woods. Mr. Powers' plan contemplated the construction of a flume connecting the ocean with the lake, the object being to convey the waters of the former through the latter, thus securing activity. In accomplishing this object, Mr. Powers relied solely upon giving natural forces full sway.

A contract for the construction of the system was entered into. The flume is a wooden structure, 60 feet wide and 11 feet deep, resting on piles about 4 feet apart. The timber, yellow pine, is bolted together, strength and durability being insured throughout. At the ocean end of this mammoth trough, which is just at the breaker line, is an "apron;" that is, an inclined plane adjusted at the end of the flume, and extending its entire width, reaching down to the ocean at an angle of 45 degrees, and extending 2 feet above the level of the flume. The breakers dash against it, leap upward and over it and fall to the floor of the flume. There the water is made captive, so far as retreat is concerned. There is no going backward, and forward dash the waves, the breakers coming over the top of the inclined plane at a rate which insures the passage into the lake of a large volume of water per hour. The whole surface of the lazy waters at once becomes energized, and the whole lake is set in motion. The presence of the salt water prevents the growth of the semi-tropical vegetation, which previously existed on the shores of the lake, and creates a sandy beach, convenient for salt-water bathing, as well as for promenades.

The work was begun in March last, and completed the early part of last month.

For 500 years the great Carl's bridge at Prague has withstood the buffeting of the risen river at various periods of its existence, only to fall in great part during the recent floods which did such vast damage throughout Bohemia and Austria. The bridge was the pride of Prague and of all Bohemia ever since its birthday, which is placed in the year 1358, about five centuries ago. Since then it has been looked upon as the great archæological treasure of the land. Emperor Carl IV, laid the foundation of the structure.

LAYING A TWENTY-INCH WATER MAIN.*

THE main in question was designed to increase the supply to the city of New London. It was five miles long, and laid generally parallel to a 16-inch cement-lined wrought iron pipe, and at a distance of from 8 to 200 feet therefrom.

The pipe was divided into two classes· Class A was used for heads of from 20 to 50 feet, was $\frac{68}{100}$ inches thick, and weighed 138 pounds to the foot. Class B, for heads of 50 to 160 feet, was $\frac{70}{100}$ inches thick, and weighed 154 pounds to the foot. It was necessary to cart the pipe over very rough roads from two to six miles, and these thicknesses were decided upon with due consideration of the effects of transportation, but were lighter than is generally used for work of this kind. The pipes were subjected to rigid inspection at the foundry, and of the total number cast 10 per cent. were rejected. Of the total number accepted at the foundry about 7 per cent. were broken in transportation or handling, or by blasting; a large majority of the breaks being checks running 2 or 3 inches from the spigot end. The percentage of cracked pipe was about the same for each class of pipe.

The bells were of a design similar to the Providence bell, being 3¾ inches deep, with ⅜-inch joint room, taking about 27 pounds of lead for each joint.

The pipe was laid on perfectly straight lines and nearly straight grades, all changes in direction being made with bends of 20 feet radius. Bends of three different lengths were used, and the angles in the line arranged to take one or a combination of two or more of these specials at each angle.

Before the pipe was covered it was tested by making a 2-inch connection with the old main, the open end of the pipe being stopped with a wooden plug bolted in. By this method any defect in calking was discovered and remedied at once, and it is thought that many small joint leaks that never would have shown above ground were thus prevented. It is believed that the little trouble and expense occasioned by the test were justified by a considerable saving in repairs, as but two small joint leaks and two cracked pipes were found in the final test, one of the pipes being cracked by a cave in of the bank during the filling of the trench.

DISCUSSION.

Mr. Jones: The first 20-inch pipe laid in Boston, when they knew but little about them, to be sure, weighed about 200 pounds to the foot, and was nearly seven-eighths of an inch thick—a little over three quarters. If a mistake was made it was made on the safe side. I can only speak in general terms about such things, but I think there are two things with regard to laying water pipes that are open to criticism; one is that they do not make them thick enough, and the other that they do not make them large enough. When the gentleman speaks about its being thick enough to stand the pressure, even if it were thinner than that, does he take into consideration the fact that the pipe is liable to decay, and does he take into consideration the question of water hammer?

Mr. Richards: The pipe in question was for a supply main without any taps off of it, and the water hammer on it would be comparatively small to what it would be in a distribution pipe in the city.

Mr. Jones: I cannot agree with the gentleman there, because the first 30-inch main in Boston burst with the water hammer from the fountain playing on the Common, and it was quite a serious break. Another break was on the top of the hill from the water hammer. The pressure then in Boston, I believe, was only about 50 pounds to the square inch.

Mr. Fuller: I would like to ask Mr. Richards if he couldn't have got his curves with straight pipe, if he had sufficient radius, without using specially cast pipe.

Mr. Richards: Yes, they could have been made with straight pipe, but the joint room, three-eighths of an inch, would have necessitated a very large radius.

Mr. Darling: You have the short bell, and you cannot make a curve in them; with a longer bell you could curve your pipe more.

The President (Mr. Dexter Brackett): I suppose there is no question but that the thickness of pipes in general use is larger than is necessary to withstand the static pressure; but the constant tendency at the present time is, I think, toward increase of pressure, on account of increased heights of buildings, and on account of the water hammer, due to the increased use of water elevators. The pressure on the pipes is in many cases increased very much beyond what they originally were designed to withstand. In Boston we have large sections of the city where the pipes laid in 1848, when there was a pressure of perhaps 40 pounds, are to-day, by the substitution of high service, withstanding a pressure of from 90 to 100 pounds, to say nothing of the additional pressure due to the water hammer. I think the increasing tendency in this direction must be considered by any one who is designing a system of water supply.

Mr. Darling: I think the greatest mistake that is made by a great many towns and cities to-day is that they try to economize too much in putting in not only light pipe, but in putting in small sized pipe. As our president has remarked, there is a constant tendency toward an increased use of the water. In the first place take the hydrant service. That is one of the greatest and most important features of any water-works, to say nothing about the family use. Then when you come to take on this new feature, which the insurance companies have brought up by the introduction of the automatic sprinklers, you have got to provide for that in addition. Then, too, there are the elevators, and a general increase in the use of water for all purposes, and you must have large pipes to get such a service as you want. So I say that the greatest mistake to-day is that cities and towns do not put in pipes large enough to provide for the growth there is sure to be in the years to come. They are too careful, too economical, too prudent. They should put in larger-sized pipes and pipes of good thickness. Now, when you speak of water-ram, you don't know what circumstances will produce it. There are to-day, with these new complications, ten chances that you will get a water-ram where there was not one years ago. With the elevators and sprinklers you do not know what minute you are going to be called upon to furnish an excessive supply of water at some particular point, and that is controlled by the parties themselves; and they do not stop to think whether they should not take time enough in shutting off the water, but they are liable to shut it off immediately; and if they do shut it off immediately you are going to get a water-ram—you cannot help it.

Mr. Jones: Our president neglected or forgot to mention something with regard to the decay of water-pipes in Boston. Boston, to be sure, is on the seaboard; fortunately not all water-works are so situated; and a good many pipes here are laid in ground that has been filled in from the docks with dock mud. In ten years after the water-works were laid here, 12-inch pipes, that were nearly five-eighths of an inch thick, were so damaged by this dock mud that you could cut them with a knife as you cut a lead-pencil; and they are taking them out every week now, I suppose, that you can cut in the same way. So, certainly, it is policy in Boston to use pipe large enough to resist, for a reasonable time, such influences. It may be that is something which does not have to be taken account of in the country, but, nevertheless, if I was to lay pipes again, I should try to make a mistake in the direction of laying large pipes.

Mr. Tidd: I believe, with the gentleman who has last spoken, that the thickness of pipe should be governed somewhat by where it is to be put. I have no doubt that in a soil such as he speaks of, a thicker pipe would be required than, perhaps, would be required in a different soil. But with the soils which we usually meet in building water-works through the country, my impression is we have been using unnecessarily thick pipe. My attention has been called to that particularly by reading the reports of tests at the Watertown Arsenal. The breaking strain of a 16-inch pipe, I think $\frac{44}{100}$ of an inch thick, was about 4,800 feet head. Now it seems to me we might get along with one half that, for probably the water-hammer never would come up to 25 per cent. of it. In the early stages of water-works construction it was customary to use very thick pipe, but I think the experience we have had lately will warrant us in using thinner pipe in many places. I have always believed in the principle of prevention of water ram wherever possible. I don't believe that shutting off a 4-inch pipe with a valve should ever be allowed. I think that will break any pipe. It seems to me, as I have said before, we have been wasting a great deal of iron. I agree with the gentleman who has last spoken as to the size of the pipes. I never knew a pipe too large, but I have seen lots of them too small.

ANCIENT AMERICAN TOOLS.

IN speaking of ancient American tools, Mr. H. F McLeod, of the Smithsonian Institute at Washington, recently said: "Aboriginal carpentry was the chief trade of our predecessors on this continent. The Indians and the mound builders had a very good idea of wood-working. You will see even now some very pretty joining done by Sioux Indians. Their tent poles make a fit which many a white carpenter would not like to try to better. The best carpenters, of course, were the Aztecs, who had arrived at quite a high stage of art, and whose tools, although they knew nothing of steel, are really excellent. We have a few of their tools at the Smithsonian, but the best collection is, of course, in the City of Mexico. The material used was almost wholly glass, especially for the finer parts of their wood-cutting. To chop trees they used flint axes, and for the rough hewing out of logs the same; but when it came to the accurate fitting in of the hewn timber, they handled glass knives, chisels and saws very deftly, and with beautiful results. There is a ceaba-wood post in Washington with hieroglyphics and faces cut upon it, all with glass. You can see bits of the original chisel still sticking in a corner of the wood, where it broke off three centuries ago under the hand of the workman. The Aztecs knew how to make a very good and manageable glass, and their best cutting blades, swords, daggers and spears, saws, chisels and axes were made of it. When the edge dulled they broke it from the end instead of sharpening it, and got a new cutting line. You can see a great deal of aboriginal carpentry still in use among the Moqui Indians of the United States. Of course they use our tools now, but they follow their old patterns."

Correspondence.

Communications giving information or opinions on matters of general interest to the engineer, the architect, the contractor, or the municipal officer, will be welcomed in this column. Fairness will suggest that when communications are sent simultaneously to this and other journals we should be informed of it at the time. Anonymous letters will not be noticed.

LARGE SIZE VITRIFIED PIPE FOR SEWERS.

ST. LOUIS, October 13, 1890.

To the Editor of THE ENGINEERING AND BUILDING RECORD:

SIR: The opinions of engineers concerning the value of vitrified pipe sewers of the larger diameters are of interest and value, and I have followed the recent communication in your columns on the subject.

Sewer pipe was not extensively used in St. Louis prior to 1878, because the material then in this market was of insufficient strength. Mr. Robert Moore, then Sewer Commissioner, adopted specifications requiring heavier pipe. This demand being responded to by the production of "double strength pipe," the local use rapidly extended, and no failure due to the pipe has since occurred. For several years sizes over 18 inches diameter were sparingly used, but as experience gave ground for confidence the use up to 24 inches diameter has extended. We now use it freely.

A late instance, in another city,* apparently to the discredit of 30-inch pipe, has come to my knowledge. The sewer failed by collapse under the following conditions. It was laid in a narrow trench, and the pipes were not properly bedded; a railway track was laid in the street, partly over the sewer, and used by dirt trains. Under such circumstances crushing of the pipe was but a natural result.

In the early days of sewer construction some single-ring brick sewer was built in this city. So far as strength alone is concerned it has answered its purpose, but such construction was long since abandoned. Where present cheapness of construction is a necessity, a single ring may be used, especially when, as is frequently the case, the town may be expected to outgrow its baby clothes. In other words, cheap sewers may answer until the questions of: How deep? and how large? are more definitely settled than is possible when the sanitary necessity for sewers first comes to the front. Under the hard service of large cities, particularly the industrial sections, whose sewers must receive everything and at times run under head, the double ring will repay manifold the additional cost, when good material and workmanship is required throughout.

ROBERT E. MCMATH, Civil Engineer,
Sewer Commissioner.

Questions and Answers.

All questions relating to building construction, paving, sewerage, water supply, or kindred subjects, will be welcomed in this column provided they relate to matters of general interest and are not such as should properly be referred to a consulting engineer. Answers will be carefully prepared and a proof of both question and answer mailed to the inquirer as early as proper consideration will permit. They will be published for the benefit of other readers as soon as convenient. The full name and address should be given, not necessarily for publication, but as a guarantee of good faith, and to facilitate further correspondence in case the question is not sufficiently explicit.

Inquiries of the Editor, in order to secure prompt attention, should *not be written on the same piece of paper as a communication* to the *Publishing Department.* Letters renewing subscriptions are sent to a clerk in the publishing office, and matter for the Editor, if in the same enclosure, is likely to be overlooked unless it is on a separate piece of paper, so that it may be promptly sent to the Editor.

LAYING WATER MAINS AROUND CURVES.

W. H. RICHARDS, Superintendent of the New London, Conn., Water-Works, writes:

"I notice in your paper of October 18 an inquiry regarding the maximum deflection allowable in laying water pipe around curves.

"The maximum *possible*, as you state, depends on the depth of bell and joint room, but the usual practice of making all but short curves with straight pipe seems to me to be wrong, in view of the increase in friction occasioned by the projection of the spigot end on the inside of the pipe. It will be readily seen that any considerable deflection throws the spigot against the inside of the bell on one side and out into the pipe on the other. If specials are used for all considerable changes in direction, and the pipes are laid on straight lines from special to special a less depth of bell and smaller joint room is possible, thereby effecting a considerable saving in weight of iron in the bell and lead in the joint and, on the larger mains at least, I suggest this as the best practice."

THE first electric car ever operated in Rochester, N. Y., was run over one of the street car lines on October 18. The overhead wire system is used.

---

*This refers to East St. Louis, where a pipe collapsed.—ED.

DOMESTIC PLUMBING HEATING LIGHTING & VENTILATION ENGINEERING

ELECTRIC MOTORS.

(Continued from page 316.)

THE CROCKER-WHEELER MOTOR.

IN the motor built by the Crocker-Wheeler Electric Motor Company, 430-432 West 14th Street, New York, every attempt has been made to combine great durability and efficiency. The result has been a motor, which, in a comparatively short time, has come into extensive use. It is made for both arc and incandescent light circuits.

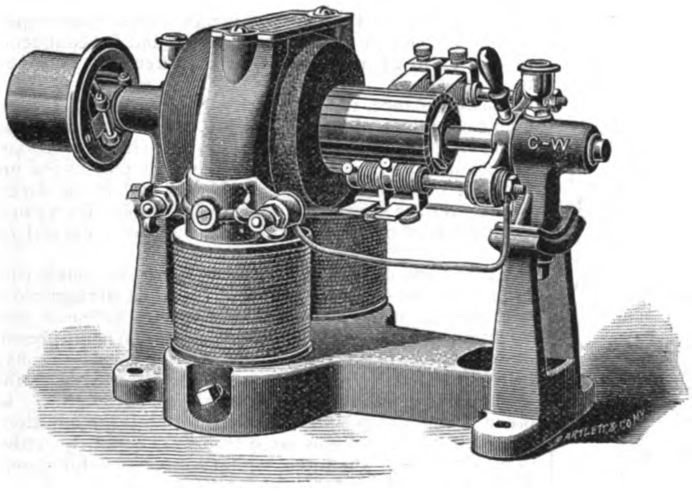

FIG. 13.—ONE-HALF H. P. ARC MOTOR.

CROCKER-WHEELER MOTOR CO.
GOULDS MFG. CO. SENECA FALLS N.Y.

FIG. 14.—PUMP OUTFIT.

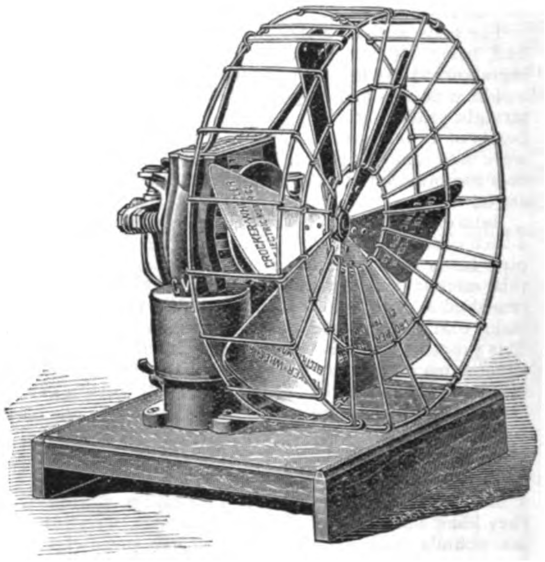

FIG. 15.—FAN OUTFIT.

THE CROCKER-WHEELER MOTOR, MADE BY THE CROCKER-WHEELER ELECTRIC MOTOR CO., NEW YORK.

Figure 13 shows a ½ horse-power arc circuit motor. The regulation of speed is produced entirely by a mechanical governor inclosed within the pulley. The action of this is simply to allow the armature to be thrown out of the field longitudinally by the attraction of the field for a second mass of iron placed behind the armature. There is no switch or electrical regulator of any kind on the motor. The regulating mechanism is entirely non-electrical and separated from the motor, and can be easily taken apart and adjusted by any machinist. Dimensions of ½ horse-power motor, 22½x12x12¾ inches; weight, 106 pounds; speed, 1,800. The larger sizes, both arc and incandescent, are made in the same style.

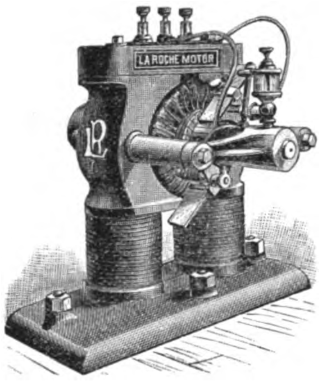

Fig. 16.—ONE H. P. MOTOR.

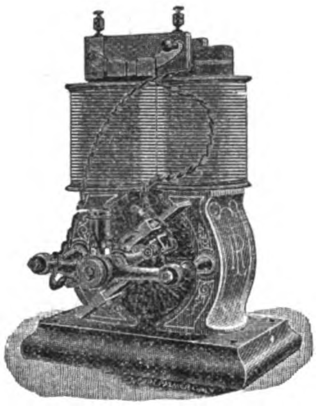

Fig. 17.—ONE-EIGHTH H. P. MOTOR.

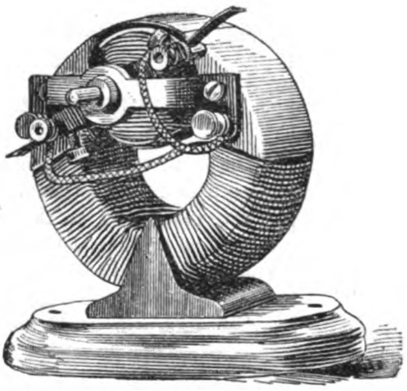

Fig. 18.—ONE-TWENTIETH H. P. MOTOR.

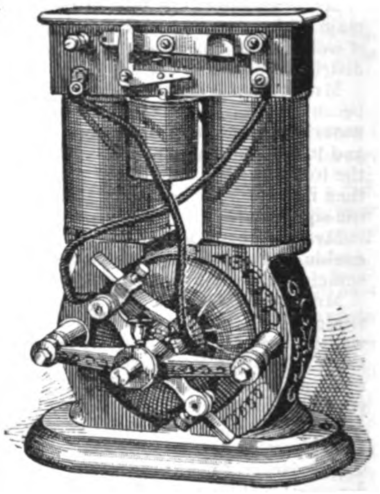

Fig. 19.—ARC MOTOR.

THE LA ROCHE MOTOR, MADE BY THE LA ROCHE ELECTRIC WORKS, PHILADELPHIA, PA.

Figures 14 and 15 show a pump outfit and a fan outfit, respectively, both having ⅛ horse-power motors. The pump is of the triplex type, made by the Goulds Manufacturing Company, of Seneca Falls, N. Y. The complete outfits, as shown, are, however, furnished by the Crocker-Wheeler Company. Similar outfits, fitted with ⅛ horse-power motors, are also available, and still larger pump outfits are made with ½, 1 and 5 horse-power motors. The motors are either belted or geared to the pumps.

The sizes in which the motors are ordinarily made range from ⅛ to 50 horse-power.

THE LA ROCHE MOTOR.

The La Roche Electric Works, 116 North Sixth Street, Philadelphia, Pa., make a motor designed for both arc and incandescent circuits, and illustrated in Figs. 16, 17, 18 and 19.

Figure 16 represents a motor made in sizes ranging from 1 to 5 horse-power; Fig. 17 shows a style varying from ⅛ to 1 horse-power; Fig. 18 shows a motor of $\frac{1}{20}$ horse-power designed for battery use, and Fig. 19 shows what the makers call their automatic constant-current (arc) motor. This, they explain, is so made that it cannot burn out or run away in case the belt should come off, and will cut itself out and close the circuit, avoiding danger or injury to the motor.

The commutators are made of tempered copper, and the motors are very highly finished. They all have improved carbon brushes and adjustable brush holders, and run at speeds ranging from 800 to 1,000 revolutions per minute.

(TO BE CONTINUED.)

NON-CONDUCTING COVERINGS FOR HOT-WATER PIPES AND RESERVOIRS.

IN the course of a series of articles on hot-water supply, published in the London *Builder*, the following particulars are given on covering pipes and reservoirs for saving heat:

"It is no exaggeration to say that very shortly no apparatus for hot water supply will be considered complete or finished if the whole system is not insulated, so to speak, so that almost every particle of heat absorbed by the water in the boiler will be obtainable from the taps, instead of nearly 50 per cent. of it being radiated from exposed surfaces, and worse than wasted.

"There are at this moment hundreds, if not thousands, of hot-water systems that, by being carefully covered, would be converted from miserably inefficient to highly satisfactory appliances—this in particular with the tank system, when the tank is so commonly fixed in a cold, draughty roof.

"An interesting instance of the success attending the covering of pipes occurred quite recently, in which a residence was fitted with a complete system of hot-water supply pipes on a scale sufficiently large for a good boiler in a 5-foot kitchen range, but owing to a delay experienced in obtaining the range in question, another of a smaller size, 3 feet, was fitted up and connected to the chimney and circulating pipes for temporary cooking and hot water supply. It was not supposed that this little range with its boiler would do much in the way of water heating, but to the astonishment of everyone it gave a really abundant supply of very hot water in every part of the house as quickly in the morning and altogether as satisfactorily as a larger range would be expected to do.

"This desirable result was wholly brought about by the pipes and cylinder being everywhere carefully covered with a sufficient thickness of felt. It really does seem opposed to all reasonable and workmanlike principles to allow such abundant opportunity for heat to be thrown away, while labor and fuel is being expended in the kitchen apparently for this object. The waste of heat is not always the only ill result experienced, as in many instances the warmed air is very objectionable, and if a hot-water pipe is carried alongside a soil pipe it is possible for a very unpleasant feature to introduce itself. It is a very customary practice for a hot-water fitter to carry his pipes up in the casing that is nearly always to be found passing from the bottom to the top of the house, this casing containing all the different pipes of the house, such as the cold service from the main, the cold service down from cistern, the water closet cold-water services, and, very commonly, the soil pipe. There is no objection to his making use of this casing if it is large enough to hold a few more pipes, and it is often used of necessity, as to carry pipes openly through well-decorated rooms is out of the question; but to carry hot-water pipes up this case without felting them is an exceedingly bad practice, as they are not only brought into contact with very cold surfaces (they have frequently been found wired on to cold pipes, four or five pipes in a bundle), but the heat radiated causes a draught or current of air to set in, as we find in a chimney.

"When a casing contains pipes that radiate heat, that casing, within a few moments after the heat is felt within it, is converted into a flue, as by applying heat to air it can be made to circulate to all intents and purposes like water. Air that is brought in contact with heated surfaces becomes heated and rarefied, and, being thus made lighter than the surrounding air, rises, and cold particles immediately flow in to take its place, they becoming heated and following the first particles, and so on, so that it resolves itself into a stream of warm air flowing out of the upper part of the casing, and cold air flowing in in corresponding volume below. This may be excellent in practice when hot-water pipes are used for effecting ventilation; but it is fatal to hot-water services which are particularly required to keep the heat within them; in many instances they are cooled at about the same speed as they would be if placed outdoors when a strong wind was blowing.

"It may be argued that if the casing is stopped off at its two extremities the trouble will be obviated; and so it would be if the casing was perfectly air-tight everywhere, and had no cold pipes within it. But this is never the case; there are always numbers of crevices and apertures which permit of a tolerably free ingress and egress of air.

"The best material for covering these pipes, and also the reservoirs, is hair felt; hair is a natural poor conductor of heat, and nothing surpasses it for this purpose, especially as it is so easy of application. This felt, which is readily obtainable in sheets, is usually cut up in strips for pipe work; the strips are wound upon the pipe spirally, being secured here and there with cord or wire, but where spiral winding is impossible it can be tied on in lengths, which answers equally well, but has not such a good appearance.

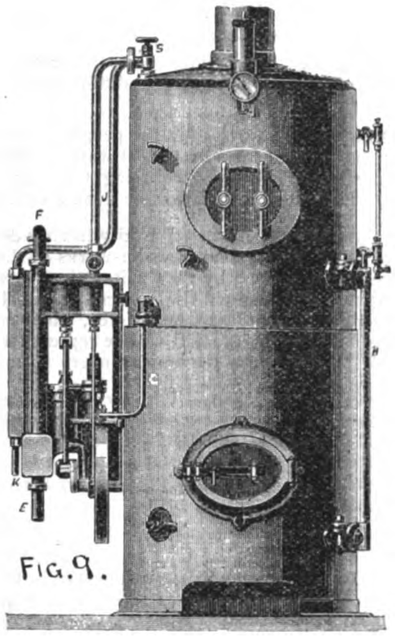

FIG. 9.

KIRKALDY'S SYSTEM OF HEATING BUILDINGS.

THE ENGINEERING AND BUILDING RECORD.

"The best and most complete arrangement for pipe work, but which entails a little greater expense, is to have the felt wound on spirally in one direction, say from left to right, and well secured with cord; then cover this with good canvas, also wound on, but in the opposite direction, and this secured with wire.

"It is most necessary, to secure the best results, to have the felt thick enough; hair-felt is sold in great quantities about $\frac{3}{16}$-inch thick, but this is not thick enough for good work. If possible, have it ½-inch thick, and a marked benefit will be had by using even thicker than this, or, say, two thicknesses of ⅜-inch.

"In felting cylinders, it is the best plan to take sufficient sheets of felt, and then sew the edges together to form one sheet large enough to go all round the reservoir. This sheet can then best be secured by bands of hoop iron or brass passed round at top and bottom, and around the middle; these bands being tightened up by having a bolt to draw the two ends together. After this circular pieces can be cut for top and bottom, these pieces being sewed on to the top and bottom edges of the large sheet. Tanks can be covered in exactly the same way.

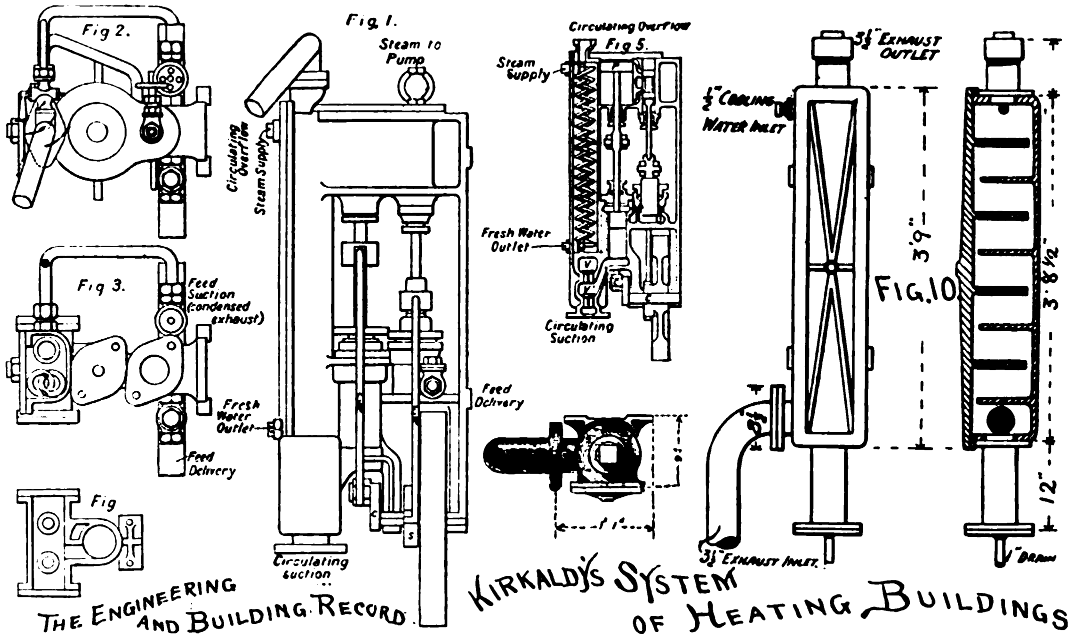
"Sometimes it is desired to encase the tank or cylinder with woodwork. This makes by far the neatest job, though more expensive, and it causes a little trouble should it be necessary to open the reservoir under some circumstances. If it is decided to have a casing it is very important that the space between the woodwork and the reservoir be well filled in with some poor conductor of heat, such as cow hair (plasterers' hair), slag wool, or even dry sawdust answers very well when the casing can be filled from the top. If the casing is not "packed" with something it would be much better to be without it, as it would have a current of cold air passing up through it the same as explained with the general pipe casing just referred to.

"If the hot water service pipes are carried up through the house without entering the general pipe casing mentioned, and it is proposed to incase them for the sake of appearance, this casing must also be packed for the reasons explained, but this is frequently neglected with the worst results, as the casing of pipes is frequently done for appearance sake only, the question of radiation not being considered.

"Occasionally it is found practically impossible to carry the pipes up inside the house, in which case it becomes necessary to carry them outside. This is very objectionable, but where it cannot possibly be avoided the objections do not avail, but they must be guarded against. In the first place, the pipes must be incased, and the casing ought to be of fair size, so that 1½ inch of packing can be filled in between the woodwork and any of the pipes. The packing must fill the case tightly, and it is imperative that the casing be well and tightly secured to the wall, as, should it get loose, the woodwork and the packing will come away from the pipes and leave them exposed.

"When pipes are carried outside the packing is not only needed to prevent great waste of heat, but there is a danger to be guarded against in cold weather when the pipes are liable to be frozen and an explosion possibly ensue, as the only outlet for any steam that may be generated in the boiler is at the upper extremity of the expansion pipe, unless a safety valve is provided."

THE Cambridge, Mass., water board, with invited guests, representing for the most part the members of the Cambridge city government, made its annual tour of inspection of Freshpond and Stonybrook on the 9th inst.



KIRKALDY'S SYSTEM OF HEATING BUILDINGS.

FROM a recent issue of the London *Engineer* we reproduce the accompanying illustrations of the apparatus made by Messrs. John Kirkaldy, London, for a new system of heating by means of hot water, and at the same time for supplying baths and other requirements.

All difficulties concerning circulation are avoided by the use of a small, constantly-working steam pump, the water circulated being heated by means of a steam heater, which utilizes the exhaust steam from the steam pump. The pump is of simple positive-action form, and may be used as a fire engine. The condenser is also as made for condensing the steam from electric light engines, and thus preventing the noise of exhaust and effecting a considerable economy.

Figure 9 shows the general arrangement, and the details of the condenser and steam pump, as employed for the heating apparatus at Epsom College, are shown in Figs. 1 to 6. Figures 1 to 4 give various views of the steam pump, and Figs. 5 to 6 show the condenser and heater and the connecting and eccentric rods of the pump. Figure 10 shows the jet condenser used with the apparatus. These engravings are so fully lettered that they are self-descriptive. In Fig. 9, which shows a complete set of apparatus, heater and pumps, but not the pipes, E represents water to be heated; F, water heated; and G, boiler feed, which includes the condensed steam. The heater and condenser may be placed underneath the pump In this case it would be horizontal, and would form the bed-plate for the pumps.

IT is anticipated that the St. Clair tunnel will be available for traffic next February.

INCREASING USE OF THE ELECTRIC MOTOR

THE rapidity with which the electric motor is forcing its way into all sorts of places, and notably into private houses, attracts more attention day by day.

An instance of the way in which the handy little machine insists on recognition is the case of a Brooklyn hotel, which, not long ago, ordered a small motor for running an exhaust fan. Soon after it was found expedient to use another small motor for running the knife-scouring machine. Following on this came an order for a four-horse power motor for washing dishes, and immediately after a ten-horse power motor was put in for the purpose of running the whole laundry of the hotel. The new machines were found so quiet in running, and so clean and effective in their work, that almost everything in the hotel that was formerly done by the steam engine is now done by electric motors.

NEW YORK STREET CLEANING STATISTICS.

THE report of the Street Cleaning Department for the quarter ending September 30 shows 314,179,228 square yards of streets swept and 355,461 cartloads of ashes and garbage collected, of which 19,850 loads were used to fill in city lots, the rest being dumped at sea. The amount paid to the city for the privilege of trimming scows was $13,886 60. Expenditures for all purposes aggregated $264,411.68, or $105,359 12 less than for the first quarter of the year and $83,111.95 less than for the second quarter.

Notes and Queries

on Domestic Engineering.

Communications relating to the practical details of plumbing, heating, lighting and ventilation will be welcomed in this column. The writer's true name and address must always be given, but an assumed name may be used for publication if preferred.

HOT-WATER HEATING IN AN APARTMENT HOUSE.

N. BARRY & SON, sanitary and heating engineers, Muscatine, Iowa, write:

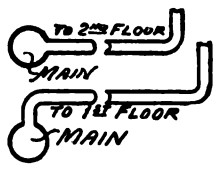
"Can you give us the address of parties making radiator shields or hoods?

"In your issue of October 11, showing hot water job in Brooklyn, the risers E, 2½-inch pipe, show connections to main with nipples looking down. Is this an error of draughtsman, or is it as actually put in? If so, would you kindly give your readers information. We have, in practice, put in nearly the same thing. When one large main acted as flow-pipe for two floors, the radiators not standing over each other in line, we have taken branches for second floor from side of main, and for first floor from top."

[We are not certain that we correctly understand the question regarding radiator shields. The Tuttle & Bailey Manufacturing Company and the Simonds Manufacturing Company of New York, and all other makers of registers, make coil screens. In the West the Crane Bros. Manufacturing Company, of Chicago, make screens for radiators and coils. The Gold Car Heating Company of New York make a hooded radiator with register in its top.

With regard to the second question, Mr. A. T. Rogers, with Messrs. Johnson & Co., of Catskill, N. Y., who executed the work, writes :

"Concerning the nipples looking downward in branch E, as shown in your illustration of our Brooklyn job in issue of 11th inst., we would say that the sketch is correctly drawn. As stated in your description, the ceiling of cellar is only about 6½ feet high, and in order to secure head room all branches were kept as near to the ceiling as possible. The 3-inch branches, supplying risers E and F, are placed side by side, and close to the ceiling for head room, and hence, at least one of branches E, must drop in order to pass the 3-inch pipe. Riser E supplies five radiators, averaging about 75 square feet each, one on each floor, and directly above each other, as shown in Fig, 4. Riser F supplies only one radiator, which contains about 90 square feet, and is in the main hall on the first floor, the second floor above the cellar, so that riser E has columns of hot and cold water three stories higher than riser F, which effectually counterbalance the retarding effect of the nipples looking downward as noted. Riser F has a straight run, which counterbalances the greater height of riser E."]



ANNUAL REPORTS.

ANNUAL REPORT OF THE CITY ENGINEER OF THE CITY OF PROVIDENCE, R. I., for the year 1889.

This report, by S. M. Gray, the City Engineer, opens with a detailed account of the expenses and operations of the City Engineer's department for the year. This is followed by an elaborate register of meteorological observations during the different months of the year. This gives thermometric and barometric readings, percentages of humidity, direction and velocity of wind, state of weather, etc., for every day of the year. Tables are also given of the amount of water pipe laid in different streets, the location and size of pipe, the monthly and annual and the average daily and monthly consumption of water during the year, location, sizes and lengths of sewers built during the year, etc. A special chapter is devoted to highways, giving details of paving and other street work. Parks and public buildings, bridges and harbor work are treated of in the concluding chapters.

ANNUAL REPORTS OF THE DEPARTMENT OF THE BOARD OF PUBLIC WORKS, CITY OF NEW HAVEN, CONN. for the year, 1889.

The first of the several reports in the pamphlet is by the Clerk of the Board, and briefly reviews the work of the year in the way of street improvement, bridge repairs, etc. The report of the City Engineer, Albert B. Hill, covers the same ground more in detail, and embraces also the report of the Superintendent of Sewers. Extensive tables are given, showing the prices of constructing the sewers and putting down and repairing pavements, and the cost of grading streets and repairing bridges.

TRADE PUBLICATIONS.

BATH TUBS.

AN attractive, eight-page circular has just been issued by the J. L. Mott Iron Works, 84–90 Beekman Street, New York, giving illustrations and particulars of a number of different styles of baths turned out by them. Dimensions and prices are furnished together with brief descriptions, though the latter are made almost unnecessary by the finely executed engravings, which tell their own story. An inclosed sheet directs attention to the firm's catalogue of fountains and drinking fountains, statuary, vases, stable fittings, etc.

STEAM REGULATING DEVICES.

A NEW illustrated catalogue, dated October 1, 1890, has been issued by the Mason Regulator Company, 10 Central Street, Boston, Mass. It is devoted to the various steam regulating devices made by them, and gives not only price lists and illustrations, but also intelligent descriptions of the apparatus. Steam engineers will find in it some interesting and profitable reading.

ORNAMENTAL METAL WORK.

THE Jackson Architectural Iron Works, 315 East Twenty-eighth Street, New York, have prepared a number of photographic reproductions of ornamental metal work manufactured by them. There are, in all, twelve finely executed plates showing aluminium bronze railings, wrought-iron balconies, lamps and scroll work, gates and stairs, giving a very good illustration of the capacity of the makers for work of that kind.

Novelties.

Devices are described under this head purely and strictly as news; because believed to be new and calculated to interest readers.

In no case is pay accepted, directly or indirectly, for publishing a novelty notice.

As the subjects are selected for their supposed novelty and interest merely, it will, of course, be understood that the selection does not imply indorsement.

AUTOMATIC WATER FEEDER FOR BOILERS.

THIS feeder consists essentially of a closed chamber A, freely communicating with the boiler by pipes B to the steam space, and C to the water space, and supplied with feed water through pipe D.

The water level is the same in chamber A as in the boiler; when it falls it operates a weight which admits feed water, and when the water level has become high enough the supply is again shut off. H H are two levers whose fulcrums K K are supported by cross-bar L. A solid annular weight, J is suspended from the outer ends of levers H H by links I I, and a cup E, full of water, is suspended by the rod F from the cross-head G. The latter unites the inner ends of H H. When the chamber A is partly full of water its buoyancy makes J overbalance E, thus raising the inner ends of levers H H, and operating the toggle joint composed of cross-head G and arms M M, so as to force valve N close up to its seat, as shown, and shut off the supply through D. As the water level falls in the chamber A, the cup E, ceasing to be buoyed up, overbalances the weight J, depresses the inner ends of levers H H, and the operation of the toggle joint withdraws valve N and admits water through D; *e* is an adjustable cap screwed up to compensate for the wear of rubber disk *d*; Q is a gauge glass.

THE ENGINEERING AND BUILDING RECORD.
WEAVER'S PATENT AUTOMATIC WATER FEEDER

The device is patented and manufactured by James W. Weaver, Toronto, Ont.

BOOK NOTICES.

FIRE PROTECTION AND WATER SUPPLY for 1890; Published by *Fire and Water*, New York.

The purpose of this volume is to present to those interested complete statistics regarding the fire protection and water supply in the different cities and villages of the United States and Canada brought down to date. For readily apparent reasons statistics of this kind can scarcely be accepted as entirely reliable and complete, but the work of collecting them, we have no doubt, has been conducted with care, and the list thus probably represents the best available information on the combined subjects.

The cities and villages are classified by States, alphabetically, and in each case are given the population, character of mercantile and private buildings, the equipment of the Fire Department, and the main particulars of the water-works. The importance and value of the information thus offered in conveniently accessible shape will be at once appreciated.

CONTRACTING INTELLIGENCE

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." *Information of importance sent to us exclusively, and not elsewhere published will be liberally paid for.*

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source

For works for which proposals are requested see also the "Proposal Columns," pages i-ii-338.

WATER.

For Additional Water Items see Proposal Columns.

EUFAULA, ALA.—The water-works question continues to be the principal topic of conversation with the officials and taxpayers of this place.

MONTGOMERY, MINN.—A special election held here has voted $5,000 for a system of water-works. Work will begin immediately on a deep well, pump-house and a large reservoir, with water mains and hydrants through the streets.

DEL NORTE, COL.—As the people of this place have voted for a system of water-works, the next step will be advertising for proposals, which, it is stated, will be done at once.

MONTGOMERY, ALA.—The city having decided to buy the system of water-works of this place, now operated by the Capitol City Water Company, has retained the services of J. H. Turner, of Mobile, Ala., as referee, while the Water Company's interests will be represented by M. M. Tidd, the Boston engineer.

HAVERHILL, MASS.—The city has decided to take control of the system of water-works of this place, now operated by the Haverhill Aqueduct Company, and has retained the services of M. M. Tidd, C. E., of Boston, as an expert.

FLORESVILLE, TEX.—Mayor A. D. Evans writes: "It is not contemplated by the City Council to establish public water-works in this place at present. Some private parties have had the matter under consideration with a view of establishing a stock company."

VANCOUVER, WASH.—The following bids for building and completing a water-work plant were received by O. M. Hidden, October 11: J. T. Goss, Vancouver, not guaranteed, $2,950; M. A. Cook, Portland, Ore., guaranteed, $3,886.

BELLEVILLE, ILL.—A shortage of the water supply of this place, which exists at present, will probably result in improvements being made to the plant.

DES MOINES, IA.—The City Council has ordered the laying of water-mains through numerous streets of this place.

MISHAWAKA, IND.—The taxpayers of this place voted in favor of establishing a water-works system, at a recent election.

KIRKWOOD, MO.—Reports say that John W. Andrews is at the head of a project to establish a system of water-works at this place.

EAST ST. LOUIS, ILL.—The Webster Grove Water Company has been incorporated at this place, with a cash capital of $25,000. J. S. Kendrick can furnish details.

MASON CITY, IOWA.—The sum of $20,000 is to be expended on a system of water-works for this place.

LEXINGTON, NEB.—The estimated cost of the water-works proposed for this place is $20,000.

PORTLAND, ORE.—It has been decided to add 9 miles of mains to the water-works system at this place.

AUSTIN, TEX.—The contract for the construction of a granite dam across the Colorado River has been awarded to Bernard Corrigan, of Kansas City, at $500,000, to be completed in two years. It will be 60 feet high and 1,200 feet long.

HALLETTSVILLE, TEX.—The following bids for the construction of a system of water-works were received by W. Blakeslee, City Clerk, October 6: G. Jaeger, Rich Hill, Mo., $14,685; J. W. Moore, Lampasses, Tex., $15,000.

October 25, 1890.

WATER.

SIOUX CITY, IOWA.—The City Council has eceived a report from D. A. Decrow, a repreentative of the Holly Manufacturing ompany, calling attention to the necessity f adopting a plan looking to increase of vater supply, suggesting going to the Misouri River for a source, at a point three miles bove the city. The report suggests a pumpng plant of 10,000,000 gallons daily capacity or delivering water into the settling basins, nd a pumping engine of 6,000,000 or 8,000,00 gallons capacity for high service should be provided. The engines and boilers now in use could then be removed to the new station and serve as auxiliaries to the new high service pump. A storage reservoir, of at least 10,000,000 gallons capacity, should be built on the highest practical point between the proposed pumping station and the city.

MERIDEN, CONN.—At a special city meeting held here, for the purpose of taking action on the water-works question, choosing a new reservoir site, etc., it was first decided to construct the proposed system at Kensington, and then the following resolutions were adopted: "*Resolved*, That the sum of $200,000 be appropriated for the construction of water-works, to be expended under the direction of the Common Council, and said Common Council is authorized to borrow money, as it may be needed, to complete said water-works, not exceeding, in the aggregate, the above-named sum. *Resolved*, That the Common Council be authorized to take such legal steps as may be necessary to make application to the Legislature for permission to issue water bonds for a sum not exceeding $200,000." For complete particulars, address Mayor Page, as above.

KNOXVILLE, TENN.—The Knoxville Water Company is before the Council for permission to issue bonds to remodel and extend its system. The company contemplates a new suction main about three-quarter mile long, also remodeling the pipe lines and extending them several miles, also doubling the reservoir capacity.

ABERDEEN, WASH.—The question of expending the sum of $50,000 on a water-works system for this place is to be decided by the taxpayers at the approaching election.

PITTSBURGH, PA.—It is stated that the project to organize a new water company to supply the south side of the city with water is progressing, and that on November 6 an application will be made for the charter for the prospective company. Edward F. Hays, Thomas Miller, Charles G. Miller, and others, of this city, are interested.

HEBRON, NEB.—The City Clerk of this place advertises for bids for the construction of a system of water-works. For further particulars, see our Proposal Columns.

LOS ANGELES, CAL.—The Bear Valley and Alessandro Development Company, of this city, has decided to build a water storage reservoir, to hold water for irrigating 100,000 acres of land.

CHARLESTON, S C.—The supply of the local water-works system is to be increased.

ROCHESTER, N. Y.—The Common Council, October 21, authorized the special committee on additional water supply to enter into contracts with owners of water-power on Hemlock, Conesus, and Canadice Lakes, and their outlets, subject, however, to the approval of the Board, in order to ascertain the exact cost of procuring a supply of water from these sources. Alderman Kelly, of the committee, can furnish particulars.

MINNEAPOLIS, MINN.—One of the important improvements the water-works department will make next year is the laying of a 36-inch water main along Second Street to Fifth Avenue S, where it will connect with the old system of distribution from the West side pumping station. This main will be 10,107 feet long and will cost, when completed, in the neighborhood of $95,000.

ELWOOD, IND.—D. H. Hick writes from here as follows: "There have been no steps taken yet to establish water-works in Elwood. There is talk of water-works next season. Can't tell as yet what steps will be taken."

CHICAGO, ILL.—Two reports on the additional water supply for the Lake and Hyde Park districts have been submitted to the Council Finance Committee, one by Acting City Engineer Cheney, and the other by his assistant, Bernard Feind. It is reported that Mr. Cheney's plan involves an expenditure of $400,000 to $500,000, while that of Mr. Feind would cost from $700,000 to $880,000.

NORTH TORONTO, ONT.—The Water-works Committee has reported in favor of obtaining the town's water supply from Fox Creek. The report was adopted. The creek is about a mile distant, and the cost is estimated at $67,000.

WATER-WORKS.—See our Proposal Columns for information regarding water-works and water-works furnishings at the following places: Hebron, Neb.; Madison, Ind.; Van Wert, O.; Charleston, S. C.; Rushville, Ind.; Philadelphia, Pa.; San Antonio, Tex.; Galt, Ont.; Columbus, O.; Chamberlin, S D.; Huron, S. D.; Chambersburgh, Pa,

SEWERAGE.

For Additional Sewerage Items see Proposal Columns

LA GRANGE, ILL.—The authorities here will establish a system of drainage, at a total cost of $250,000. A large ditch will be constructed running three miles to the Des Plaines River, having a fall of over 50 feet.

LOWELL, MASS.—The Board of Aldermen have authorized the construction of numerous additional sewers at this place.

ROCHESTER, N. Y.—The Common Council, on October 21, decided to adopt the report of the East Side Sewer Committee, recommending at the instance of Mr. Emil Keuching, Engineer, the employment of a consulting engineer to examine and report upon Mr. Keuchling's plans and estimates for the east side trunk sewer, at an expense not to exceed $500.

SAN FRANCISCO, CAL.—Plans for the Point Lobos sewerage district have been approved, and proposals for doing the work will soon be wanted.

DAYTON, O.—The contract for sewering this city has been awarded to Bruno Ritty, of this city, at $66,175.20. The complete table of all the bidders was published in these columns last week.

ROCHESTER, N. Y.—The contract for constructing the sewer on East Main Street has been let by the Executive Board to William H. Jones & Sons, the lowest bidders, for $26,259.50. The next lowest bid was by N. L. Brayer, for $31,227.70.

ALBANY, N. Y.—The City Engineer has been instructed by the Board of Contract and Apportionment to prepare plans and specifications for numerous additional sewers.

JOLIET, ILL—A. Comstock, City Engineer, recently began the improvement of what is known as the "slew drain," by building a substantial wall and using concrete for the bottom. About $10,000 has been spent already, the entire cost of which will be about $40,000. The work will be continued next season.

WALTHAM, MASS.—It is stated that the Sewerage Commission recently organized here is about ready to report a detailed scheme for local sewerage, and that within the next 30 days the Aldermen will have the report before them and an order asking the necessary appropriation. The entire system will be constructed under contract.

FLATBUSH, L. I.—At a meeting of the Board of Street and Sewer Commissioners, held last week, Engineer McElroy, of the Board, was directed to prepare plans and specifications for the sewering of the principal streets of Windsor Terrace.

QUINCY, MASS.—C. W. Spear, Clerk of the Council, at this place, writes: "The Committee on Sewerage have reported a bill to the Council, if it is accepted, the Legislature will be asked to authorize the city to build in accordance therewith."

MONMOUTH, ILL.—This city is now being surveyed by J. E. Miller, C. E., under direction of Corthell & Wallace, civil engineers, of Chicago, preparatory to preparation of plans by them for a sewerage system.

CHARLESTON, S. C.—At a meeting of the City Council, held October 14, the joint committee on sewerage submitted a report recommending that an expert engineer be engaged to make a survey of the city with a view of establishing a system of sewerage. The report was adopted and steps will be taken at once to carry out the project. Alderman J. Fred. Lilienthal or the City Engineer can furnish particulars.

TRENTON, N. J.—Additional sewers are to be established in this city. Alderman Kulp can furnish information.

LANCASTER, PA. — Street Commissioner Smeltz has been directed to prepare plans for sewering certain streets of this place.

JERSEY CITY, N. J.—At a meeting of the Finance Commissioners, held October 21, a communication was read from James Moylan urging the immediate construction of the joint sewer between Jersey City and West Hoboken, which, according to the document submitted, will cost $67,850. The communication was referred to the Corporation Counsel for an immediate opinion as to the power of the Commissioners in the premises. Particulars can be obtained by addressing President Somers, of the Board of Financial Commissioners, as above.

KNOXVILLE, TENN.—The surveys for a sewer system for this city have been completed, and plans and estimates will soon be ready. The question of issuing bonds for construction will then be submitted to a vote of the people.

SEWERS.—See our Proposal Columns for information regarding sewer construction at the following places: Detroit, Mich; Buffalo, N. Y.; Des Moines, Iowa; Albuquerque, N. M.; Rothville, Mo.; Victoria, B. C.

BRIDGES AND IRON STRUCTURES.

For Additional Bridge Items see Proposals Columns.

ST. PAUL, MINN.—(By Telegraph.)—The Board of Public Works awarded contract for superstructure of Sixth Street bridge, to Chicago Forge and Bolt Company, at $128,875.

WEST BAY CITY, MICH.—The estimated cost of the bridge which it is proposed to erect over the Saginaw River, at this place, is $41,000. The plans for the structure are about completed.

COBURG, ORE.—A bridge is to be erected over the McKenzie River, at this place.

DETROIT, MICH.—Reports say that a high level bridge is to be constructed over the Detroit River, at this place.

SAVANNAH, GA.—The Macon and Atlantic Railroad contemplates constructing an iron bridge across the Savannah River just below this city. This bridge will be of iron, and will be used for traffic purposes as well as for railroad.

WEST BAY CITY, MICH.—The estimated cost of the proposed bridge to be erected over the Michigan Central tracks, at Washington Street, this city, is $82,567.76. The plans are now in the hands of the Board of Public Works.

BROOKLINE, MASS.—At a special meeting of the Selectmen of Brookline, the contract for building the abutments to the new bridge over the Boston and Albany Railroad, on Dean road, was awarded to D. H. Cram, for $8,331.

AUGUSTA, GA—At a meeting of the City Council, held October 16, a contract was awarded to G. H. Crafts, of Atlanta, to build an iron bridge over the Augusta canal, near the cotton factories. The contract is for $11,800.

LANCASTER, PA. — At a meeting of the Street Committee, held October 21, City Regulator Herr was directed to prepare plans and specifications for a bridge over the Conestoga at Reigart's Landing, and report at the Committee's next meeting.

BATH, ME.—The following proposals for a 60x16 iron bridge were opened October 20, by B. W. Huse, Town Clerk: Wrought Iron Bridge Company, Canton, O., $1,995; Pittsburg Bridge Company, Pittsburg, Pa., $2,011.

HARTLAND, ME.—This town will build an iron bridge at once. The Bridge Committee is E. J. Smith, S. M. Davis and A. Webber.

PITTSBURG, PA.—The plans for the temporary bridge connecting Forbes Street entrance with Shenley Park, this city, are about completed. The estimated cost of the structure is $20,000. For particulars address Chief Bigelow, as above.

OAKLAND, CAL.—L. J. Le Conte, Assistant Engineer in charge of the work on the Tidal Canal, between Oakland Harbor and San Leandro Bay, is working on the designs for the iron and steel draw-bridge across Park Street. As soon as they are finished, it is probable proposals for the construction will be wanted.

RICHMOND, VA.—It is probable that estimates will soon be wanted by the City Engineer for the construction of a viaduct which it is proposed to build in this city The estimated cost of the work contemplated is $200,000. Alderman W. M. Turpin can furnish particulars.

SALEM, MASS. — The following proposals for the construction of the Pow-Wow River bridge, at Amesbury, Mass., have been opened by the County Commissioners: Pittsburg Bridge Co., Pittsburg, Pa., $8,316; Smith Bridge Co., Toledo, O., $8,175; King Iron Bridge and Mfg. Co., Cleveland, O., $8,143; Wallis Iron Works, Jersey City, N. J., $8,050; Vermont Construction Co., St. Albans, Vt., $8,029; Wrought Iron Bridge Co., Canton, O., $7,296; Dean & Westbrook, New York City, $7,280; Berlin Iron Bridge Co., East Berlin, Conn., $7,795. The contract for the iron work has been awarded to the Boston Bridge Works, at $7,487. For the stone work to Joseph Ross, of Ipswich, Mass., at $11,900, and also the contract for the foot bridge to the same party, at $1,265. This work is to be carried on under the general supervision of the Engineer, C. A. Putnam, of Salem, Mass.

BRIDGES.—See our Proposal Columns for information regarding bridge construction at the following places: Philadelphia, Pa.; Greensburg, Pa.; Joliet, Ill.; Zanesville, O. Willimansette, Mass.

NEW DEPOTS.

CHATTANOOGA, TENN.—It is reported that the Chattanooga Southern Railroad Company is about to erect a large freight shed at this place.

STREET-WORK AND PAVING.

CHICAGO, ILL. — Acting City Engineer Cheney is preparing plans and estimates of the cost of changing the street grades and inclines for several streets, in accordance with the proposition made and profile presented by the Rock Island Road to elevate its tracks.

NORWALK, CONN.—The contract for macadamizing West avenue, has been closed with Connor Brothers & Co., of New Haven, at 74 cents per square yard for macadam and $3.50 for rock excavation. It is estimated that there will be about 19,000 yards of macadam.

CHATTANOOGA, TENN.—Numerous streets of this place are to be repaved at once.

GRAND RAPIDS, MICH.—At a meeting of the Aldermen, held October 20, a resolution was passed which authorizes the paving of all the business streets in the Second Ward of this city. For further particulars address Alderman Sproul, as above.

WASHINGTON, PA.—The Town Clerk at this place informs us that about 50,000 yards of paving is to be done here next season.

LANCASTER, PA. — Numerous streets of this place are to be improved. For particulars address Street Commissioner Smeltz, as above.

ALBANY, N. Y.—The Board of Contract and Apportionment has ordered the paving of numerous streets of this city, and the City Engineer is now preparing the specifications for the work.

SCHENECTADY, N. Y.—The Common Council has authorized the paving of numerous streets of this city. Alderman Holtzman can furnish particulars.

FOND DU LAC, WIS.—The paving of several streets has been authorized at this place.

POTTSVILLE, PA.—It has been decided to do considerable paving at this place.

OTTAWA, ONT.—The Council of this place have decided to do considerable street paving.

SARATOGA, N. Y.—The contract for doing certain street work at this place has been awarded to P. Calliman, of Albany, N. Y., at the following figures: Excavating streets named, 30c. per cubic yard; macadamizing, including stone, 45c. per square yard; same, village furnish stone, 25c. per square yard; paving gutters, 2c. per square yard; laying crosswalks, 4c. per lineal foot; 1,600 cubic yards of stoning, $1.55 per cubic yard.

SAGINAW, MICH.—At a meeting of the Common Council, held October 20, City Engineer A. W. Roberts recommended that a committee be appointed to investigate what, if any, material for pavement and what, if any, method of paving, other than that now used by the city, can be introduced at a saving to the city and without detriment to the condition of the streets.

STAPLETON, S. I.—The Supervisors of Richmond County met October 20, and awarded contracts amounting to about $50,000 for repairing 6½ miles of county roads and macadamizing them with Telford pavement. Estimates for the repair of 26 miles of roadways had been received, but all bids, except where awards were made, were considered excessive by the Board and rejected. The Board will readvertise for bids for the repair of 30 miles of road soon. The awards made Monday were as follows: P. Hart & Son, of New Brighton, $23,218; Bernard Mahon, of New York, $12,005.40, and D. Donavan, of Port Richmond, S. I., $15,208.40.

RAILROADS CANALS ETC.

CINCINNATI, O.—I. J. Miller has been granted a charter for a street railway called Route 23, going from the head of Elm Street through Clifton and adjoining suburbs.

GAS AND ELECTRICITY.

ST. JOHNS, QUEBEC.—The St. Johns Electric Light Company has been incorporated here, with a capital stock of $50,000.

MARION, PA.—Gas works are to be established at this place by M. C. Watson and others, who propose to expend the sum of $50,000 on the undertaking.

QUINCY, MASS.—Improvements are to be made to the plant of the Quincy Gas Light and Coke Company.

MOUNT CARMEL, PA.—Operations on the proposed electric light plant for this place are to begin at once, by the Edison Electric Illuminating Company.

BEDFORD, IND.—It is proposed to expend the sum of $20,000 on establishing an electric light plant at this place.

PHILADELPHIA, PA.—The Diamond Electric Light Company has been organized, for the purpose of supplying the outlaying wards with incandescent lights. It is proposed to put the wires underground. For particulars address William J. Latta, of the Pennsylvania Railroad.

HOWELL, MICH.—Operations are to begin at once on the construction of the electric light plant which is to be established at this place by the Howell Electric Light and Power Company.

WILTON, IOWA.—An electric light plant is to be established at this place at once.

ALEXANDER, LA.—The City Council of this place has contracted with the Thomson-Houston Company for an electric lighting plant.

DAWSON, GA.—Operations are to commence at once on the construction of an electric light plant for this place.

NORWICH, N. Y.—This place is to have an electric lighting plant.

KEOKUK, IOWA.—The Gate City Electric Lighting Company has been granted a franchise to establish and maintain an electric lighting business in this city for a term of 20 years.

HURON, S. D.—The South Dakota Gaslight and Heating Company is about to establish a plant at this place. It will be necessary to lay 5,000 feet of mains.

RICHMOND, PA.—It is proposed to expend the sum of $75,000 on the projected electric light plant for this place.

CHEROKEE, IOWA.—It is probable that the electric light plant projected for this place will be established at once by the Cherokee Electric Light and Power Company, which has obtained the exclusive right to erect and maintain a system throughout the city.

COVINGTON, KY.—At a special session of Council, October 20, a charter was granted the Rosendale Electric Railroad Company. The company is to build and operate an electric street railroad from Rosendale through Covington to Cincinnati. It will begin work at once.

DAVENPORT, IOWA.—At a meeting of the City Council, held October 21, the City Engineer was instructed to draw up proper specifications, and advertise for proposals for lighting the public streets for a term of 3, 5 or 7 years. For details address City Clerk Joe L. Herbert.

SEATTLE, WASH.—The following proposals for public lighting have been opened by the Street Lighting Committee: The Seattle General Electric Company—15 candle-power incandescent, $2.20; 30 candle-power incandescent, $3.50; 2,000 candle-power arc, $12. Home Electric Company—15 candle-power incandescent, $2.20; 30 candle-power incandescent, $3.45; 2,000 candle power arc, $12.50. The contract was awarded to the Seattle General Electric Company.

ELECTRIC RAILWAYS.—New electric railways are to be constructed, and improvements are to be made to those already established at the following places: Mahanoy City, Pa.; Springfield, Mass.; Newburyport, Mass.; Amesbury, Mass.; Anaconda, Mont.; Helena, Mont.; Rock Creek, Ill.; Bay City, Mich.; Rockland, Mass.; Buffalo, N. Y.; Alton, Ill.; Norwich, Conn.

NEW CORPORATIONS.

THE Hegeman Oliphant Filter Company have reorganized under the laws of New Jersey; capital, $500,000. President, Robt. Hay; Wm. Oliphant, vice-president; M. M. Moore, secretary and treasurer; directors: Chauncey M. Depew, Wm. Oliphant, Robt. Hay, R. B. Seymore, M. M. Moore.

SAN FRANCISCO, CAL.—The American Brewing Association, of San Francisco, has been incorporated, the objects of which are to conduct a brewery, also a bottling and cooperage establishment, etc. The capital stock is $3,000,000. Particulars can be obtained by addressing I. B. L. Brandt, Incorporation Attorney, as above.

INDUSTRIAL.

NASHVILLE, TENN.—A new race track and surroundings, to cost $40,000, will be constructed here.

NEW PHILADELPHIA, O.—Capitalists of this place will build a $50,000 works for the manufacture of tile and street brick. City Clerk can give information.

JERSEY CITY, N. J.—Plans submitted by Architect Broome, for the proposed new public school No. 24, have been accepted, and the clerk has been instructed to advertise for proposals.

WINNIPEG, MAN.—Local capitalists have made a proposition to construct a dam across the Assinniboine River, at Winnipeg, to utilize the stream for water power.

ST. THOMAS, ONT.—It is rumored that the M. C. R. intend constructing a tunnel under the Detroit River, between Courtright and St. Clair, and making the St. Clair branch the main line of the way.

BIDS OPENED.

NORWALK, CONN.—The bids received by the County Commissioners from contractors for the construction of the new County Home building, were all in excess of the appropriation. Nineteen bids were received, ranging in amount from $16,000 to $19,000. The appropriation was $15,000, and $2,700 of this amount has already been paid for the site. The commissioners have altered the plans, and have requested new proposals under the present arrangement, it being intended to construct a building, which, when completed, will cost about $12,000.

ST. LOUIS, MO.—The following proposals for work on the inshore tunnel, engine, etc., at the Chain of Rocks, were opened October 14, by the City Engineer:

	Quantities.	Wm. McCully, St. Louis, Mo.		Black & Davis, St. Louis, Mo.		McCormick Construction Co., St. Louis, Mo.		Hill & O'Meara, St. Louis, Mo.		Allen & Vieths, St. Louis, Mo		Fruin Bambrick Construction Co., St. Louis, Mo.

U. S. ENGINEER OFFICE. BOSTON, MASS., October 15, 1890 —Sealed proposals, in triplicate, will be received at this office until noon of November 24, 1890, for **DREDGING** in BOSTON HARBOR, MASS., 70,000 cubic yards of material, more or less. Attention is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. For full information apply to S. M MANSFIELD, Lieut.-Col of Engineers. 23

BRIDGE, Zanesville, O.—Proposals are wanted until November 11, for the construction of a bridge across the Muskingum River. Address J. A. Knight, Auditor, as above.

RESERVOIR, Philadelphia, Pa.—Proposals are wanted until November 7, for the construction of a reservoir. Address Louis Wagner, 1321 Filbert Street, as above.

STREET WORK, Norwood, O.—Proposals are wanted until November 5, for doing certain street work at this place. Address E. G. Balles, Village Clerk, as above.

SPECIAL OFFERS.

DOUBTLESS many of our subscribers have a friend or friends who think of subscribing to THE ENGINEERING AND BUILDING RECORD for the coming year, and as every paper, however successful it may be, desires to increase the number of its subscribers, the following offers are made, to hold good during October, November and December, 1890:

Any present subscriber can have his subscription extended one year by sending:

One Renewal and One New Subscription..$7.25
" " " Two " " ..10.00
" " " Three " " ..13.00
" " " Four " " ..16.00

The new subscribers will receive, free of charge, the remaining issues of 1890, that is, those which appear after the order is received.

THE ENGINEERING AND BUILDING RECORD,
P. O. Box 3037. 277 Pearl Street, New York.

SEWERAGE AT HOBOKEN, N. J.

Two reports on a general sewerage plan for the city of Hoboken, N. J., recently submitted by Thomas H. McCann and Alphonse Fteley, seem to show that there is urgent need for improvement in the sewerage of that city.

Of the 720 acres included within the limits of the city, which occupies a long and rather narrow strip between the Palisade ridge and the Hudson River, 450 acres were marsh land. About one-third of this land has been reclaimed, most of it in the southern part of the city, and is occupied by tenement houses with a dense population. The streets built across this old swamp are only from one to five feet above high tide. About seven miles of sewers have been built in this low district, partly of brick, partly of wooden boxes, 3 feet by 4 feet in size, in most cases with no grade whatever, or a very slight one, and with their bottoms about one foot above mean low water. Two of the three outlet sewers, with a practically level grade, discharge into the Delaware and Hudson Canal, 3,000 feet from its connection with the river; and the third outlet, although connecting directly with the river, is also practically level. It is little wonder, therefore, that the death rate should be large in this low-lying tenement district.

In the system of sewerage recommended by Mr. McCann, with Mr. Fteley's approval, it is proposed to divide the low marshy district, which extends north and south between the Palisade ridge and a low ridge on the banks of the river, into two parts, the northern part being yet little occupied, and to treat each separately. For the southern district, two interceptors, with branches, will be provided, placed sufficiently deep not merely to drain the existing sewers, which are but little below the surface of the streets, but also to intercept new laterals and laterals which must be built in the future to replace the wooden and other defective ones now existing. These would be placed considerably deeper than the old ones in order to lower the subsoil water and drain cellars. These interceptors will discharge the sewage, including storm water, into a pump well near the southern limits of the city, from which it will be raised by centrifugal pumps, and discharged, through an iron outlet pipe, into the Hudson River at the pier line. A separate system for sewage and roof water was carefully considered, but the conclusion was arrived at that it would be preferable to provide for pumping the entire rainfall from the district, as well as the sewage, rather than to construct a double system of sewers. The pumps will have a capacity for disposing of six inches of rainfall in 24 hours on the above-mentioned area, and also on 50 acres draining from the Palisade ridge—336 acres in all. Overflows are to be provided for disposing of the storm water, through the old outlets, by gravity when it exceeds the capacity of the pumps.

The area of the Northern District contains 135 acres, of which 100 are marsh; 100 acres of the Palisade ridge, not within the limits of Hoboken, also drain into it. For this district the combined system, with pumps capable of handling 6 inches in 24 hours from the 235 acres, is also recommended; but as there are very few buildings now in the district, it will not be necessary to construct this portion of the system for some time to come. Meanwhile, temporary measures are suggested for draining the marshes, which are now cut up into several separate basins by the streets crossing them. It is expected that the 150 acres on the Palisade ridge, belonging to Jersey City and West Hoboken, will eventually be sewered, and will then intercept the sewage and rainfall now flowing into the low district of Hoboken, and relieve the pumps to that extent.

Proportioning laterals with a capacity for only half an inch of rainfall (reaching the sewers) per hour, seems hardly sufficient, with the present knowledge of the intensity of short rainfalls, especially over limited areas; and proposed grades which will give a velocity of only 2½ feet per second, with the sewers running full, will give undesirably light velocities, for sewage only, during a long dry spell. The situation of the ground may make it difficult to allow more, without considerable increase of cost from greater depth of sewers and greater lift for the pumps, and it is stated that provision may be made for flushing the sewers from the river, at high tide, when necessary. It is to be hoped, that, with the exceedingly bad conditions existing in Hoboken, the urgent need for an adequate system of sewerage will be recognized by the city authorities, and the work promptly commenced on the lines of the plans submitted. Unfortunately, no maps are published with the reports, making it difficult to understand some of the details without them.

CLERKS OF WORKS.

THE "Committee on the Employment of Clerks of Works and Superintendence," whose appointment was noticed in THE ENGINEERING AND BUILDING RECORD of February 1, of this year, has made its report to the American Institute of Architects, at the Annual Convention at Washington, last week. This report recognizes the importance of a constant and continuous supervision in the erection of buildings, especially in structures of importance, and strongly recommends the employment of Clerks of Works. It considers that the Institute can materially assist in hastening this very desirable result.

The first point needed is to make the employers and clients of the architect realize the necessity of this constant oversight of the contractors, and recognize, moreover, that the payment for it must be made by them. The salaries of the needed Clerks of Works cannot come out of the ordinary commissions of the architect, although many employers now seem to expect it. The report adds that in England few buildings of any importance are now erected without a Clerk of Works. Formerly he was often a builder's foreman or an architectural assistant seeking to acquire practical experience, but now "men specially trained for the duties, at regularly recognized salaries, have become so numerous that they have in successful operation a society of their own, the Clerk of Works Association of Great Britain."

THE ENGINEERING AND BUILDING RECORD has taken a strong stand in favor of constant supervision of all important buildings, during their construction, by Clerks of Works, and is glad to see from this report that there are hopes of this reform being more widely adopted. Whether a rate of $30 per week, however, for buildings costing from $20,000 to $200,000—particularly for those near the larger limit—is going to secure really capable superintendence, especially in the larger cities, is open to question, and it seems undesirable that the amount should be limited. The pay of United States Government Superintendents, or Clerks of Works, is generally from $6 to $9 per day ($42 to $63 per week)—occasionally, on small buildings, as low as $5 per day ($35 per week), but generally on such buildings not less than $6.

For large and important works a capable engineer would make the most desirable Clerk of Works, or assistant in charge of construction, being not only conversant with the work of construction, but also being more thoroughly posted in the necessary strength required in the details of the structure than are most architects at the present time. The statement, moreover, made in the report, that the architect is not responsible for the contractor's misdoings, seems a little too broad. He may not be pecuniarily responsible for the carelessness or rascality of the contractor, but he should be held responsible for the honest construction of his works in the same sense that a chief engineer is responsible for the proper construction of engineering works under his charge, especially if he has the assistance of Clerks of Works who have been appointed with his approval.

NOTES.

A break in a 12-inch water main, at Harrisburg, Pa., last week, caused considerable damage.

The stand-pipe of the water company at Temple, Tex., gave way on October 25, and considerable damage was done by the escaped water. The pipe was 20 feet in diameter, and 150 feet high.

At a recent meeting of the Albany Institute, at Albany, N. Y., pavements and irrigation were discussed in an interesting manner. London and Paris pavements and the irrigation system of Arizona were the chief topics.

The Philadelphia Natural Gas Company has decided to cut off all large manufacturing establishments supplied with gas by its lines, and devote itself entirely to private consumers, and claims it will then have an ample supply for everybody.

According to the Pittsburg, Pa., *Dispatch*, the Butler County oil producers have subscribed $150,000 toward the building of a pipe line, while the producers of Washington County raised a subscription to the same amount. Twenty or thirty producers of the Millerstown oil field subscribed a sufficient sum to build a pipe line to the railroad, where they will ship their product to the independent refiners of Cleveland.

St. Louis is awakening to the objections to overhead electric wires, and the question of putting all wires underground is occupying the attention of the press of that city. The experience of the fire department at a recent large fire has strengthened this movement, as the operations of the firemen were greatly hindered and the work made dangerous. The Bell Telephone Co. is before the Council with an ordinance asking a franchise to construct subways under streets and alleys.

The public hearing given by the New York Aqueduct Commissioners on October 27, on the subject of building a dam separate from the one proposed at Quaker bridge, resulted in a resolution to endorse the views of Chief Engineer Fteley, and the work will be begun at once. It is proposed to construct the dam of earth and masonry which would back up 16,000,000,000 gallons of water. The cost will be $746,000. The dam will be 105 feet high, 100 feet below the river bed, with a length between flow lines of 995 feet. It will be known as the New Croton Dam.

Eight suits have been begun in the Supreme Court, at New York, on behalf of English corporations and capitalists, against Dr. Gerardus H. Wynkoop and Theodore N. Vail, formerly President of the Boston Heating Company, and now President of the Consolidated Telegraph and Electrical Subway Company, to recover about $250,000 alleged to have been procured from them by misrepresentation. Among the plaintiffs are Sir John Penden, whose loss is placed at $50,000, and the Trustees', Executors' and Securities Insurance Corporation, the Bankers' Investment Trust Company, the United States and South American Trust Company, the Army and Navy Investment Company, and the Mercantile Trust Company, all of London.

Four hundred steam fitters and helpers stopped work at Chicago on October 27, and demanded higher wages. The strikers comprise about 90 per cent. of the steam fitters of Chicago. The strike was brought on by the refusal of the Master Steam and Hot Water Fitters' Association to comply with the demands of the Steam Fitters' Association.

PERSONAL.

M. S. Befreus has been appointed architect to the Quartermaster's Department, at San Antonio, Tex.

Fred. J. Amweg, C. E., has retired from the firm of R. C. Ballinger & Co., and opened offices in the Lucas Building, Philadelphia.

J. W. Beach, formerly with the Strong Locomotive Company, has opened an office as mechanical draughtsman at 45 Broadway, New York City.

James D. Lazell, M. E., formerly of Philadelphia, Pa., has accepted the position of Manager in the Southern office of F. J. Amweg, M. Am. Soc. C. E., at Roanoke, Va.

Minott W. Sewell, mechanical engineer, of New York, until recently with the Pneumatic Dynamite Gun Company, has opened an office at 71 Broadway, in that city.

Walter A. Fischer, architect, has opened an office at the corner of Fifty-fifth Street and Third Avenue, New York, and would be pleased to receive samples, catalogues, price-lists, etc., in the building and architectural line.

Mr. Emil Kuichling, City Engineer of Rochester, N. Y., in reporting on the east side sewer which is to be built, has suggested the desirability of having the proposed scheme submitted to consulting experts for further examination.

OBITUARY.

E. H. Cooper, a civil engineer of New York, was run down and killed by a train on the Niantic bridge, near East Lyme, Conn., on October 28.

James Suggett, credited with the invention of driven-wells, died at Cortland, N. Y., on October 23.

Contractor Nicholson was killed at Toronto, on October 21, by the caving in of a sewer trench.

Joseph Davis, one of the principal builders and best known citizens of Elizabeth, N. J., died on October 28, at the age of eighty. For a quarter of a century, in conjunction with his brother Jacob, now president of the First National Bank of Elizabeth, he carried on an extensive building business.

Brigadier-General Samuel Henry Roberts died at his home, at Brooklyn, N. Y., on October 27.

General Roberts was born in East Hartford, Conn., in 1820, and was educated in the public schools there. In 1839 he went to Michigan and engaged in the Indian Wars then going on in that region. He removed to New-York in 1850 and after being here five years crossed the river to Brooklyn. In September, 1862, he enlisted in the 139th Regiment, New-York Volunteers, and served through the war, being promoted several times for gallant action on the field, and retiring with the rank of Brigadier-General.

Oliver C. Bullard died suddenly in Bridgeport, on October 25. He was born in 1822, in Sutton, Mass. During the war he worked in the United States Sanitary Commission, and was with Butler and Banks at New Orleans. At the close of the civil contest Mr. Bullard saw the need of beautifying the breathing places of large cities, and with his friend and comrade, Frederick Law Olmstead, carried on the work of adorning Central Park, New York. He then went to Brooklyn, and much of the beauty for which Prospect Park is famous is due to his labors. His next great work was upon the Capitol grounds at Washington, and he also assisted in laying out the parks of Baltimore. Six years ago Mr. Bullard went to Bridgeport, and took charge of the parks.

HOUSE OF MARY OF BRAVA, SALAMANCA, SPAIN.

THE INTERNATIONAL ENGINEERING CONGRESS IN 1893.

A meeting was held at Chicago on October 14 and 15, 1890, to consider the establishment of an engineering headquarters and the holding of an International Engineering Congress during the World's Columbian Exposition, 1893.

The convention met at 10 A. M. in the rooms of the Western Society of Engineers, 78 La Salle Street, Chicago, Tuesday, October 14, 1890. The societies represented and the delegates present were as follows: The American Society of Civil Engineers, William P. Shinn (President), C. L. Strobel, A. E. Hunt; The American Society of Mechanical Engineers, William Forsyth, Jesse M. Smith: The American Institute of Mining Engineers, William P. Shinn, A. E. Hunt; Canadian Society of Civil Engineers, J. D. Barnett, O. Chanute; The American Institute of Electrical Engineers, E. M. Izard; The Engineers' Club of Philadelphia, H. W. Spangler, Wilfred T. Lewis, E. V. d'Invilliers; The Civil Engineers' Club of St. Louis, J. B. Johnson, E. D. Meier, Robert E. McMath; Civil Engineers' Club of St. Paul, L. W. Rundlett, W. W. Curtis, S. D. Mason (President); Wisconsin Electric Club, Warren S. Johnson; Engineering Association of the Southwest, E. L. Corthell; Civil Engineers Club of Cleveland, William T. Blunt, John Eisenmann; Engineers' Club of Minneapolis, William A. Pike, F. W. Cappelen; The Society of Civil Engineers, Paris, France, E. L. Corthell; The Engineers' Society of Western Pennsylvania, A. E. Hunt; The Western Society of Engineers, O. Chanute, D. J. Whittemore, E. L, Corthell, C. L. Strobel.

Mr. E. L. Corthell explained the object of the meeting. and several letters were read by the Secretary from officers of the Exposition, encouraging the proposed meeting, and from the President of the French Society of Civil Engineers, Paris, stating that they would be represented.

After organization and discussion a committee was appointed to formulate a plan and to report to the convention, which adjourned to meet again next morning.

The following report was submitted by them:

To the Chairman of the Convention of Delegates from Engineering Societies of the United States and Canada.

Dear Sir: Your Committee on Plan for establishing and maintaining a joint engineering headquarters in Chicago in 1893, during the World's Columbian Exposition, and for holding an International Engineering Congress at some time during the Exposition, beg leave to report:

It finds itself unable to present, at this time, more than a brief outline plan.

The proposition advanced by the Committee of the Western Society of Engineers to this convention yesterday, embodies our views, with some changes, which we have made in the plan herewith submitted:

FIRST.—ENGINEERING HEADQUARTERS.

In view of the existence in this country of several large engineering societies of high rank, which will desire the use of headquarters for their own members, and for the entertainment of foreign visitors, and the inconvenience and expense which would result from the maintenance of separate establishments, we think it very desirable that all the engineering societies of recognized standing in the United States and Canada be requested to unite in establishing and maintaining a joint engineering headquarters during the continuance of the Exposition.

The Exposition management will probably furnish space free of charge within the Exposition buildings, but it may be deemed advisable to provide additional quarters outside; the headquarters to be a rendezvous for all the members of the engineering societies in this country, and their use to be freely tendered to all foreign engineers.

It is expected that the staff shall consist of a joint secretary and two or more assistants, some of whom shall speak the principal European languages. The staff to be charged more especially with:

(*a*) To give information concerning the location of various engineering exhibits within the exposition.

(*b*) To give visiting and foreign engineers information about points of engineering interest, outside of the Exposition, and to aid their investigations in other ways.

(*c*) To give visiting and foreign engineers introduction to those whom they may desire to meet, and to promote social intercourse.

(*d*) To keep a record of the addresses of visitors, and to invite them to the International Engineering Congress hereinafter outlined.

It is estimated that the expense will amount to about $10,000. This, it is suggested, may be met by an assessment of one dollar per member on each engineering society of this country which shall join this proposed association, and also by voluntary contributions The details to be hereafter adjusted.

It is evident that this plan will be far more economical than that of maintaining separate headquarters by the several societies.

NEW YORK, VOLUME XXII.

Copyright by THE ENGINEERING AND BUILDING RECORD.

SECOND.—ENGINEERING CONGRESS.

At some time to be hereafter designated during the Columbian Exposition, it is proposed to hold within the Exposition, in a building which the management thereof proposes to furnish, an international engineering congress open to engineers of all nations. This congress to last six days and to be conducted in the English language.

The opening session of welcome and organization to be a joint session, and if warranted by the attendance and the number of papers offered, the congress then to be divided into sections to consider and discuss the various branches of civil, mechanical, mining, metallurgical, electrical, military and naval engineering.

A chairman and secretary for each section to be designated in advance, and the sessions to be so timed that papers and discussions on allied subjects shall not occur simultaneously so as to preclude those interested from attending several sections.

The congress to terminate with another joint session.

All papers, so far as practicable, to be furnished in advance, to be carefully examined by the proper committees under rules to be hereafter laid down, and, if found acceptable, to be printed for distribution in advance to the members of the congress, at which they are to be chiefly read by title so as to admit of immediate discussion.

Intending contributors to be requested to confine their papers, so far as possible, to such new and recent constructions, machines, processes, methods, experiments and investigations, including proposed standards of tests and measurements as are of engineering importance. Papers on purely speculative subjects should not be received.

A small fee (say $2) to be paid by members attending the congress to defray its expenses. The papers and discussions to be subsequently printed and furnished to such members as may so request at a stipulated price.

A permanent committee to be chosen in advance, to organize the above proposed headquarters and congress.

Respectfully submitted,
E. L. CORTHELL,
O. CHANUTE,
JESSE M. SMITH,
D. J. WHITTEMORE,
C. L. STROBEL,
W. W. CURTIS,
J. B. JOHNSON.

The report was unanimously adopted in the following resolution:

Resolved, That the report of the committee on an International Congrees and joint headquarters be accepted, and that we report the same to our respective societies, with the recommendation that action in approval or in disapproval of the same be taken within the next two months, and that we desire the present committee to be continued with power to carry on the correspondence and organization until its successor is appointed.

In furtherance of the plan adopted the following resolution was passed by the convention.

Resolved, That it is the sense of this convention that the general permanent committee on International Congress and Engineering Headquarters be composed of one member from each of the societies which shall join in the plan, except that the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers, the American Institute of Electrical Engineers, and the Canadian Society of Civil Engineers, may each appoint two members, and the Western Society of Engineers may appoint three members of such committee.

The following resolutions were also passed:

Resolved, That the secretary be instructed to prepare minutes of the proceedings of this convention and the resolutions adopted, and that he, as soon as possible, have the same printed and sent to each delegate, and the secretary of each of the societies represented.

That the Executive Committee of the Convention be empowered to call the first meeting of the delegates, provided for in the resolution adopted, at such time as they may see proper after January 1, 1891.

THE AMERICAN INSTITUTE OF ARCHITECTS.

WASHINGTON MEETING.

THE annual meeting of the American Institute of Architects was held at Washington, D. C., last week, extending from October 22 until October 24. About 300 members were present.

Owing to President R. M. Hunt's illness his place was taken by J. W. Root of Chicago.

The annual address, written by President Hunt and forwarded to the convention, was read at the first session on Wednesday, October 22, by E. H. Kendall of New York. In this eulogistic reference was made to the works of the late president of the Institute, Thomas U. Walter, and then Mr. Hunt discussed the method in vogue of planning and erecting public buildings. According to his theory the present system was all wrong, and decidedly more expensive than it should be. The decease during the past year of important members of the Institute was touched upon, especial reference being made to the deaths of John McArthur, Jr., and Henry Ogden Avery. There were many expressions of sorrow at the untimely death of Architect A. B. Mullett, and resolutions of sympathy with the dead man's family were unanimously adopted.

The greater part of Wednesday and Thursday was devoted to the consideration of various committee reports, among them those on a proposed code of professional ethics, on clerks of works, uniform contracts and indemnification.

A letter from the National Association of Fire Engineers, asking the co-operation of the architects in the matter of procuring uniform fire ordinances, and a communication from Mr. Cummings, giving an account of the progress of the excavation of Delphi, were read.

Three papers were presented on Thursday, one being on "The Foundations for Kansas City Hall," by S. E. Chamberlain; the second, on "Thoughts on Architecture," by Frederick Baumann; and the third being a sketch of "The History and Status of the American Institute of Architects," by A. J. Bloor. Mr. Chamberlain's paper is given elsewhere in this issue.

Friday morning, October 24, was devoted to routine business, and to a reception by President Harrison.

During the afternoon session a paper on "The Science of Æsthetics," was presented by Mr. Marshall. The following officers for the ensuing year were elected:

R. M. Hunt, President; W. W. Carlin, First Vice-President; J. W. McLaughlin, Second Vice-President; John W. Root, Secretary; S. A. Treat, Treasurer.

Board of Directors: W. M. Poindexter, G. B. Ferry, T. J. Clark, Alfred Stone, George C. Mason, Levi T. Schofield, E. F. Fassett, M. J. Dimmock.

Boston, Mass., was selected as the next place of meeting.

Among those in attendance were the following:

W. G. Preston, Boston; E. G. Lind, Atlanta, Ga.; W. W. Carlin, Buffalo; William C. Smith, Nashville, Tenn.; Henry Lord Gay, Chicago; John W. Root, Chicago; Augustus Eichhorn, Orange, N. J.; Cyrus T. Porter, Buffalo; W. M. Poindexter, Washington, D. C.; Merrit J. Reid, Evansville, Md.; M. J. Dimmock, Richmond; W. L. Plack, Philadelphia; C. F. Schweinfurth, Cleveland, O.; G. H. Helmle, Frederick Baumann, Chicago; E. T. Little, New York; H. A. Linthwaite, Columbus, O.; Warren R. Briggs, Bridgeport, Conn.; A. J. Bloor, New York; E. H. Kendall, New York; Thomas Nolan, Rochester; O. K. Foote, Rochester; N. J. Cayton, Galveston, Tex.; C. A. Wallingford, St. Paul; Glenn Brown, Washington, D. C.; James Murphy, Providence; S. Huckel, Jr., Philadelphia; Otto Block, Rochester; Bernard Vonnegut, Indianapolis; S. S. Godley, Cincinnati, O.; C. A. Didden, Washington, D. C.; George C. Mason, Jr., Philadelphia; S. C. Earle, Worcester, Mass.; John H. Coxhead, St. Paul, Minn.; Alfred C. Clus, Milwaukee; Gustave W. Drach, Cincinnati; R. A. McLean, Chicago; G. W. B. Ferry, Milwaukee; L. M. Randolph, Chicago; F. W. Hamble, Buffalo; R. M. Upjohn, New York; H. J. Meier, Detroit; E. W. Arnold, Detroit; A. B. Cram, Detroit; R. T. Grow, New York; Robert Stead, Washington, D. C.; J. S. Rogers, Jr., Detroit; William Martin Aiken, Cincinnati; J L. Smithmeyer, Washington, D. C.; J. G. Hill, Washington, D. C.; C. M. Bartlerger, Pittsburg; Julian Barnes, Joliet, Ill.; L. T. Scofield, Cleveland; Samuel Hannaford, Cincinnati; N. Le Brun, New York; Thomas Lemos, New York; Sidney G. Osgood, Grand Rapids, Mich.; W. W. Clay, Chicago; J. Blaby, Palmyra, N. Y.; J. Appleton Wilson, Baltimore; J. H. Pierce, Elmira, N. Y.; J. B. Noel Wyatt, Baltimore; Theodore C. Kink, St. Louis, Mo.; W. T. Eames, St. Louis, Mo.; A. F. Rosenheim, St. Louis, Mo.; H. C. Kock, Milwaukee; E. G. Fassett, Kansas City; James W. McLaughlin, Cincinnati; C. A. Curtin, Louisville, Ky.; J. W. Yost, Columbus, O.; M. Crapsey, Cincinnati; John H. Boll, Cincinnati; W. R. Brown, Cincinnati; Edward I. Nickerson, Providence, R. I.; A. P. Cutting, Worcester, Mass.; C. O. Arey, Cleveland; F. A. Wright, New York; S. A. Treat, Chicago; George W. Baxter, Jr., Syracuse, N. Y.; J. H. Kirby, Syracuse, N. Y.; T. N. Clark, Boston; Luther Peters, Dayton, O.; Fred. H. Gough, Utica, N. Y.; R. W. Gibson, New York; E. T. Carr, Leavenworth, Kan.; A. C. Bruce, Atlanta, Ga.; C. C. Burke, Memphis, Tenn.; S. M. Patton, Chattanooga, Tenn.; Frank M. Day, Philadelphia; Charles I. Williams, Dayton, O.; C. Powell Karr, New York; Jay Fay, Rochester, N. Y.; George A. Frederick, Baltimore; V. V. Shipman, Chicago; D. Adler, Chicago; George H Smith, Cleveland, O; John Eisenmann, Cleveland, O.; C. H. Owsley, Youngstown, O., George W. Thompson, Nashville, Tenn.; Arthur Rotch, Boston; Alfred Stone, Providence, R. I.; G. W. Kramer, Akron, O.

ENGINEERING SOCIETIES.

THE annual meeting of the American Society of Mechanical Engineers will be held at Richmond, Va., beginning on November 11 and lasting until November 14. The society's headquarters will be at the "Exchange and Ballard" Hotel. The following preliminary programme has been issued:

Tuesday, November 11—Opening session at 4 P. M; address of welcome by Mayor of Richmond, followed by president's annual address. In the evening there will be a reception tendered to the society by the Governor of Virginia at the Philip McKinley Gubernatorial Mansion.

Wednesday, November 12.—Business session at 9.30 A. M. In the afternoon there will be an excursion on the James River, visiting various points of interest. In the evening there will be a session for reading and discussion of professional papers.

A fourth session will be held on Thursday morning, November 12. The afternoon will be devoted to drives to various points of interest in and around Richmond. In the evening the society will be entertained by the citizens of Richmond.

On Friday, November 14, excursions will be made to the Newport News Ship Building Company's yards, the Portsmouth Navy Yard, Norfolk, and other points.

THE last regular meeting of the Engineers' Club of Philadelphia was held on October 18, President H. W. Spangler in the chair; 21 members and one visitor present.

At the previous meeting it was ordered that a committee be appointed, to consist of the president of the club and two members whom he might select, to consider the question of the participation by the club in the proposed International Congress of Engineers at the time of the coming World's Fair in Chicago. The president presented, at the hands of the secretary, a report stating that he had appointed Messrs. Wilfred Lewis and E. V. d'Invilliers as the other members of this committee, and setting forth what had been done by the committee. This report was not presented with a view of positive action by the meeting, but in order to get some idea of the sense of the club with regard thereto. On motion of the secretary, the sense of the meeting was expressed to the effect that it is desirable for the Board to consider the said report in full, and report to the club at the next business meeting.

The secretary presented, for Mr. Robert A. Cummings, a photograph and description illustrating the effect of gases from locomotive stacks upon vegetation.

Mr. Arthur Falkenau presented an extensively illustrated description of a new "Method of Making Barrels by Machinery." There was considerable discussion of this subject, principally by Messrs. Henry G. Morris, Wilfred Lewis, John C. Trautwine, Jr., Max Livingston and the author.

PRESIDENT HARRISON, on October 28, appointed Lieutenant Francis R. Shunk, Corps of Engineers; Professor Henry A. Rowland, of Johns Hopkins University, and Andrew Rosewater, municipal engineer of Omaha, Neb., a board "to consider the location, arrangement and operation of electric wires in the District of Columbia, whether used for electric lighting, transmission of power, telegraphy, telephony or signalling, with a view to procuring as soon as practicable the construction of a safe and convenient system of conduits or subways, and the placing therein of all necessary electric wires along the streets, avenues and other public places, and the removal of all unused overhead wires and their supports," as provided for in the District of Columbia Appropriation bill of 1890.

PNEUMATIC tube transmission between Philadelphia and New York for letters, newspapers and small packages, is again being talked of.

THE NEW YORK WORLD BUILDING.

PART I.—GENERAL DESCRIPTION; PERSPECTIVE VIEW; FLOOR PLANS; FOUNDATION WALLS; PIERS AND DETAILS.

THE new building for the New York *World* is known as the Pulitzer Building, and is a notable example of modern fire-proof office building construction in this and other principal cities of the United States.

Joseph Pulitzer is the owner, George B. Post the architect, R. Maynicke chief of staff in charge of the work, all of New York.

The building is designed to serve two distinct purposes—*i. e.*, to provide all accommodations for the publication of the morning, evening and weekly editions, etc., of a newspaper of large circulation, and to have rooms and suites of rooms to rent for offices and business purposes.

The entire cellar, extending under the sidewalk on Frankfort Street, and under the sidewalk and 6 feet outside of the curb on Park Row, is made 16 feet high in the clear, and the boiler-room is made 18 feet high. The basement, extending the same distance under the Park Row sidewalk, is made 10 feet high. On account of the steep grade of Frankfort Street the basement floor is only a few steps below the sidewalk at the southeast end. In the cellar are located the main engine and the presses, and in the portion under Park Row are the dynamos and engines, auxiliary engine, the elevator and house pumps, and a large storage tank for water. In the portion under Frankfort Street galleries are provided for the storage of paper prepared for the presses, and under the galleries there are compartments for the ink rollers. All the belting and shafting in the cellar is underground.

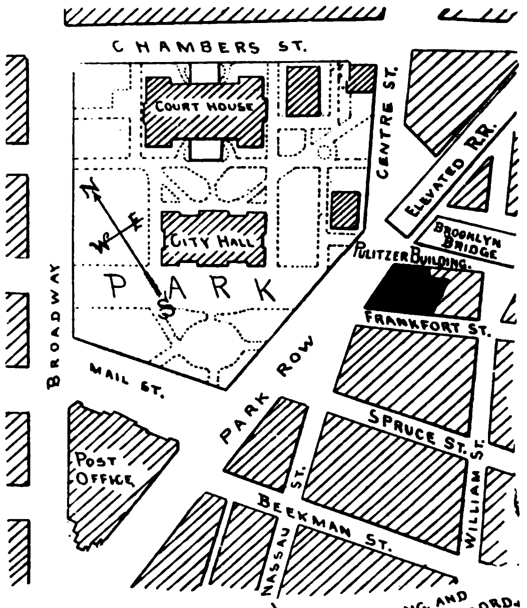
This arrangement, and the pits for the presses made it necessary to lay the foundations 7½ feet below the cellar floor. The cellar has a gallery running through the center for the use of visitors. The walls are wainscoted with glazed tiles, and above they are finished to resemble large blocks of stone. The usual steam and plumbing pipes on the cellar ceiling are omitted, and in their stead a network of overhead tracks is arranged for carrying the rolls of paper to the presses.

The basement story is occupied by the elevator machinery, and the steam and plumbing pipes are placed on this story instead of in the cellar. A large portion is taken up for the storage of roll paper and the wetting machines. There is also a room for the newsboys, and lavatories, baths and toilet rooms, and lockers for the pressmen. The entrance for the employees is on this story on Frankfort Street, with two large elevators running to the top of the building, and an entrance for those employed in the lower part. The stereotype room is located on this story over the boiler-room. This room has an iron floor and a large skylight. Two special elevators deliver the stereotype plates to the press-room. In connection with this are lavatories, bath-rooms and lockers.

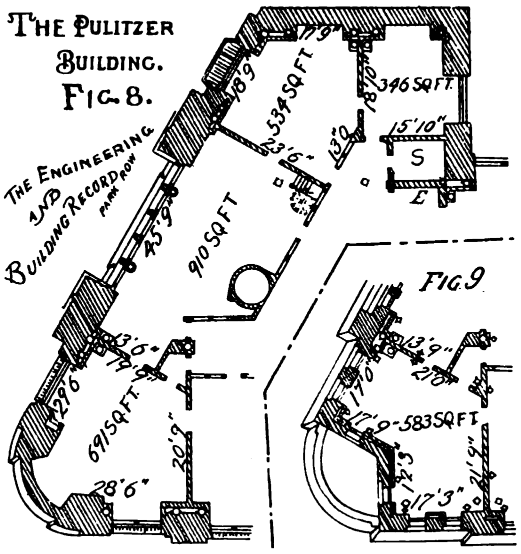
The rear portion of the building, Frankfort Street end, has two stories above the basement. The lower one is used for the delivery of newspapers, and the upper one for bookkeepers' and cashiers' departments. Four elevators carry the printed papers from the press-room to the basement and to the delivery rooms. The ground floor, at the corner, is devoted to the publication office, private offices, counting-room, etc., and is entered from the corner through a large circular vestibule with a grained ceiling, wainscoted with marble. The main entrance to the building is on the Park Row side. The walls are covered with marble. There are also three stores on this floor.

The next eleven stories are exclusively for rental for offices. The story above these is used for the composing room, and is surmounted by a flat roof on which there is a superstructure for the accommodation of the photographers and the photo-engraving department. From a special framework of steel girders in the roof, which are supported on lines of columns down to the ground, is built a steel dome that is essentially a large six-story building, complete in itself. This dome is surmounted by a lantern gallery and flagpole. The top of the dome is 275 feet from the ground. The highest standing room is 280 feet above the ground. The top of the lantern is 300 feet, the top of the flagpole is 340 feet, and the highest office floor 160 feet above the sidewalk. The dome is devoted entirely to Mr. Pulitzer's office, library, and the uses of the editorial staff.

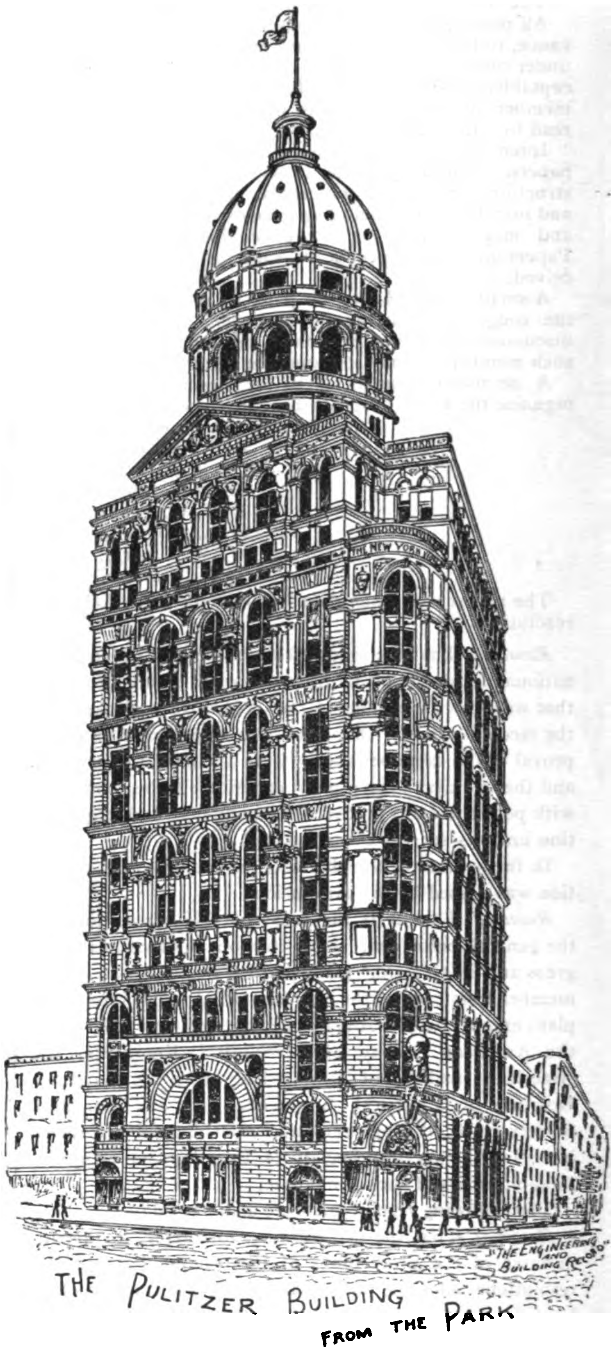
The location of the building, as shown in Fig. 1, is upon one of the most crowded thoroughfares in the world, but though the excavations extended far under the sidewalks, and the hoisting and delivery of materials and the operations of construction were for months going on adjacent to, underneath and above the sidewalks, no accident is known to have been caused to the hundreds of thousands of pedestrians, nor did they even sustain much obstruction or inconvenience. This was due, chiefly, to heavy, raised bridges over the excavations, and solid timber roofs, 4 inches thick, supported on large beams, above these bridges, and serving the double purpose of a roof to shield passers beneath, and of a working platform and storage yard when materials, etc., were received from wagons, and to which they were hoisted as required. This portion of the work was illustrated and described on page 232.



THE PULITZER BUILDING FIG. 1



THE PULITZER BUILDING. FIG. 8.



NEW YORK
THE ENGINEERING AND BUILDING RECORD

THE PULITZER BUILDING FROM THE PARK

The building has a frontage of 115 feet on Park Row, and 136 feet on Frankfort Street. The cellar floor is 28 feet below the sidewalk level, and the flat roof is 191 feet above it. The floors and roof are supported by steel I beams, carried from piers in the cellar by iron Phœnix columns. These are entirely separate from, and independent of, the walls, and were carried up several stories in advance of the masonry.

The roof and floors are of concrete on hollow-brick arches, turned between the lower flanges of the beams. The piers rest on continuous footings of concrete, carried down to a bed of gravel, and for the intermediate piers, connected by inverted arches of cut granite. All partition walls and joining are of hollow brick.

The Park Row façade is studied with a center motive, finished with a pediment at the top, supported on galvano-plastic caryatides, 16 feet high. This center portion is of Corsehill sandstone up to the fourth story above the ground floor, and above that, of buff brick and terra cotta, relieved by polished red granite columns and gray granite panels. The whole is flanged on both sides by stonework carried up to the eleventh story. The Frankfort Street façade is of the same kind of sandstone up to the fourth story, resting on a Quincy granite basement, and the upper portion is of buff brick and terra cotta. On the Park Row front, over the porch, on the fourth story, there will be four torch-bearing figures of heroic size, and the torches will be illuminated by electric light.

The stairs are of iron with Knoxville marble treads. The passenger elevators are of iron within glazed brick walls. In the woodwork finish of the building ash has been employed throughout, except in the publication office where mahogany is used. Office flooring is of Georgia pine placed upon a heavy concrete base. The halls are tiled and the entrances finished in marble. There are 3,500 electric lights throughout the building, ceiling and side lights being placed in each office with gas jets and electric lamps.

The building is heated throughout by direct steam radiators supplied ordinarily with exhaust steam, but having an available supply of live steam. There is pneumatic delivery service between the dome and the basement, and through all the corridors there are telegraph and telephone mains, from which branches lead to all offices and rooms where they are required. There are toilet rooms on every floor and wash-bowls in every office, all arranged in vertical tiers, each served by the same rising pipes. The latter are all carried up in recesses along the outside walls.

There are four paper elevators from the street level to the sub-basement, two employee elevators to the roof, three passenger elevators for office floors to the roof, and one elevator to the top of the dome. There are two Cutler U. S. mail chutes from the top story of the dome to the ground floor. As the building itself is incombustible, no fire escapes are provided other than are afforded by the wide central stairways.

The principal contractors were: R. L. Darragh, mason work; J. B. & J. M. Cornell, iron work; Perth Amboy Terra Cotta Company, terra cotta work; J. J. Spurr & Sons, cut stone work; Philip Herrman's Sons, carpenter work; Poulson & Eger, caryatides, staircases, ornamental iron work and copper dome; J. A. Rossman, plumbing and gas fitting work; Otis Bros. & Co., elevators; Batterson, See & Eisele, marble work; Baker, Smith & Co., steam heating and ventilating; U. S. Electric Light Company, electric light plant; Miller & Coates, glazed tiling; Cutler Manufacturing Company, mail chutes; Nicholson & Galloway, roofing and flashings; Pirsson & Renwick, granite work.

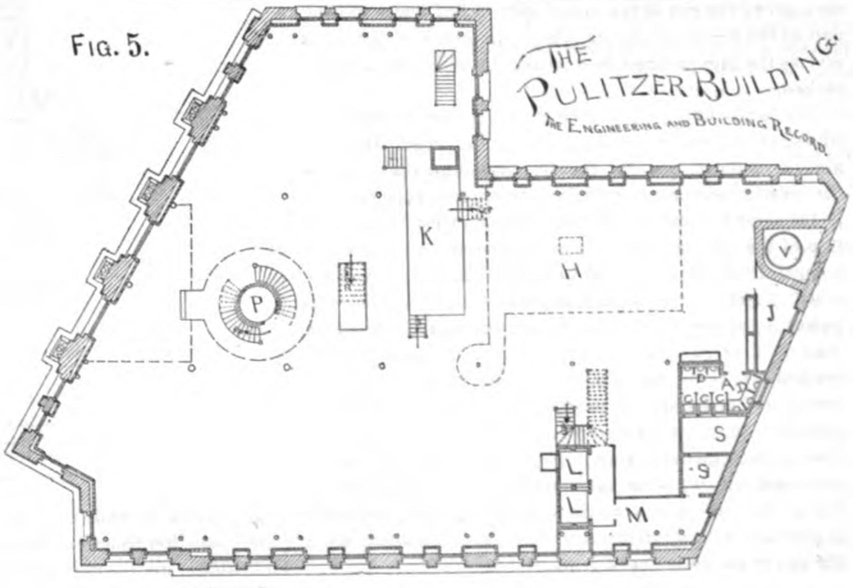

Figure 2 is a plan of the cellar; A A is the dynamo room; B is the engine room; C is the boiler room; V is the smoke-stack; W W, etc., are pits for the presses, and X is the visitors' gallery.

Figure 3 is a plan of the basement floor. A A are toilet-rooms; B B, bath-rooms; C C, etc., water-closets; D D, etc., urinals; E is a shower-bath; F F are wash-basins; G G are wardrobe cupboards; H is a storage closet; J is the pressmen's dressing room; I I, etc., are paper elevators; K K are compositors' elevators to twelfth story; L is a watchman's room; M is a tank room; S S are air and machine shafts; T T are patent illuminating tiles with ventilators; U is the stereotype room; and V is the chimney stack; O O is paper storage room; N is a store cellar; P is the machinists' room; Q Q are passageways; R is the newsboys' room; Y Y are driveways from the street; N is an iron door; W is the cashier's office; Z is the entrance down from Frankfort Street.

Figure 4 is a plan of the ground floor. A A A are stores for rental; B is the main entrance hall; S S, etc., are shafts; P P P are passenger elevators to the office floors; C is a roof, and D a skylight over the stereotyping room; E is the mailing room; F is the job room; G is the distributing and shipping room; O O, etc., are tables; V is the smoke-stack; C is the elevator to the dome; R is the counting room; H the rotunda; Q a telephone closet; U U are the street driveways to basement floor; T is a lobby; L is a sink.

Figure 5 is a plan of the twelfth story, which is devoted to the compositors' use. K is a bulkhead over the office floor elevators; P is the dome elevator; H is an elevated platform for clerks, telegraphers, etc.; J is an office; M the foreman's room; L L are compositors' elevators; S S are shafts; V is the smoke stack; A is a toilet room; C C are water-closets; D, urinals.

Figure 6 is a plan of the roof houses. S S, etc., are skylights; A is a toilet room; C C, water-closets; D D, urinals; F F, basins; J J J, engraving rooms; L, photograph room; M M, photographers' dark closets; R dining room; N N, private dining rooms; O, kitchen pantry; G G G, ventilators; H, editorial headquarters; K, elevator well; I I, closets.

Figure 7 is a plan of the ninth story. Its general arrangement is the same as that of all the other office floors, except that the rest have smaller toilet rooms, and that the arrangement of the rooms in the Park Row and Frankfort Street corner is modified in the first and eleventh office floors, as shown in Figs. 8 and 9, respectively. The eleven office floors contain altogether 150 offices.

(To be continued.)

A REMARKABLE CANAL.

The most remarkable canal in the world is said to be the one between Worsley and St. Helens, in North England. It is sixteen miles long and underground from end to end. Many years ago the managers of the Duke of Bridgewater's estates thought they could save money by transporting the coal underground instead of on the surface; therefore the canal was constructed, and the mines connected and drained at the same time. Ordinary canal-boats are used, the power being furnished by men. The tunnel arch over the canal is provided with cross pieces, and the men who do the work of propulsion lie on their backs on the loads of coal, and push with their feet against the cross bars of the roof.

BUILDERS' AND CONTRACTORS' ENGINEERING AND PLANT.

No. CII.

(Continued from page 329.)

THE WALDITOBEL ARCH CENTERING.

THE illustration of this false work is prepared from an article in the Paris *Annales des Ponts et Chaussees*, on the Arlberg Railroad, and requires little explanation.

The square panels of false work are 16.4 feet high and 16.4 feet wide. The opening, A, is of nearly 50 feet span, and the timber corresponds nearly to the following dimensions in inches: B, 8x9 inches; C, 10x12 inches; D, 6x12 inches; E, 8x10 inches, and F, 6x8 inches. The bridge is made of large, quarry-faced stone, with dressed joint surfaces, set in hydraulic lime mortar. It is about 14 feet 9 inches wide at the top, and cost about 76,000 francs, the estimated cost of an iron bridge at the same place being 66,500 francs.

The false work contained four tons of iron and 180 cubic meters (6,358 cubic feet) of wood, and cost 17.8 frances per square meter (about 33 cents—per square foot.)

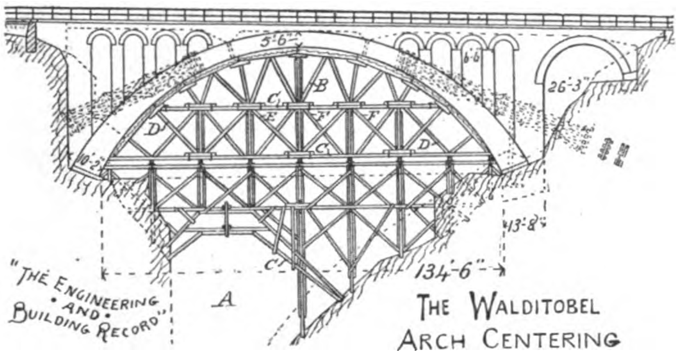
No. CIII.

THE FORTH BRIDGE CONSTRUCTION.

PART VII.—THREE-TON HAND-DERRICK CRANE.*

FIGURE 1 is a general elevation of a three-ton hand-derrick crane; Fig. 2 is an elevation of the side frame A, Fig. 1; and Fig. 3 is an elevation showing the gear wheels and other fittings.

The mast is made of two pieces of red pine, fitted into castings at the base and head. The lower one is broader than the upper, and the two sides of the mast are bent in a curve, the two lower ends being parallel a few feet from the base, to receive the cast-iron side frames, while the upper end is as narrow as possible, so that, with the necessary amount of circular motion, the back stays may come straight to the pin at the mast-head. The lower casting carries the center pivot, on which the crane revolves, as well as the lugs and cast-iron sockets by which the jib is attached.



THE WALDITOBEL ARCH CENTERING

The head casting carries the upper center, to which the iron straps connecting the back stays are attached. It carries also two pulleys, one for the jib chain and the other for the hoisting wire rope or chain. In order to keep the load at the same vertical height for any alteration in the position of the jib, the hoist chain is wound on a fusee, or conical drum, the thick end of which takes on the chain, when the jib is at its highest position. By this means less power is required to handle the jib, for, as it is raised the load is lowered and *vice versa*. At the same time the vertical height of the load is not altered in reducing or increasing its distance from the crane center. This compensation does not take place if the crane is worked by a steam winch through a hollow pivot, and the jib is the more difficult to handle in consequence, the load and jib being lifted or lowered at the same time. The jib barrel is provided with a ratchet and pawl, which holds it when the power clutch is not in gear.

The crane illustrated is provided with two safeguards against the falling of the jib when it is being neither raised nor lowered. These, by experience, have proved to be necessary, owing to the careless dropping in of the pawl. The additional safeguard is provided by the wheel, which, when not drawn forward by the lever and thrown into gear with the wheel on the hoisting shaft, slips over a projection cast on the side frame. This, passing between the arms, prevents any motion of the jib drum. By lifting the small weighted catch C, and moving the crank shaft longitudinally, the crane can be worked in single, quick, or double slow speed gear, or withdrawn entirely, to lower by the brake. The pinion on the crank shaft has 11 teeth, 1¼-inch pitch, gearing, when in double purchase, into a wheel having 48 teeth, 1¼-inch pitch, to the side of which is cast a pinion with 11 teeth, 1¼-inch pitch, keyed on the counter shaft. This pinion gears into the wheel on the main barrel shaft, having 76 teeth of 1¼-inch pitch.

The sliding wheel on the jib chain drum has 60 teeth of 1¼-inch pitch, gearing into a wheel on the drum shaft, having 76 teeth of 1¼-inch pitch. The horizontal legs are attached by straps to the base plate, and when the crane is erected lie at about right angles to one another. They are 24'8"x8"x7" red pine.

The back straps are at an angle of 45 degrees with the horizontal, and are fastened by bent straps to the horizontal legs and mast-head casting. The jibs, usually from 45 to 55 feet long, are 12 by 12 inches at the center, tapering at the ends to 8 by 8 inches, where they are fitted into cast-iron shoes or sockets, the lower one grasping the horizontal pin through the lugs on the casting at the mast base. The jib head casting carries a wheel, varying in diameter, according to whether the crane is used with wire rope or chain, and a boss on its under side, through which passes a pin, carrying the shackle supporting the jib.

3 TON HAND CRANE WITH 50 FT. JIB USED ON FORTH BRIDGE.

A CABLE rack railroad is to be built at Prague, Austro-Hungary. In virtue of the contract entered into the municipality of Prague is to commence building the road at once, to complete and give it over to traffic within one year, and to operate it for a period of 75 years.

WATER POWER FOR AUSTIN, TEX.

THE continuous advance of the "New South" in industrial pursuits is illustrated by the movement to secure for the city of Austin, the capital of Texas, not only an efficient system of water-works and electric lighting, but also an abundant water power for manufacturing purposes.

The project, which bids fair to make a manufacturing center of the capital, having at present some 20,00 inhabitants, including the suburbs, is outlined in a report* by Mr. Joseph P. Frizell, M. Am. Soc. C. E., to the city authorities.

The city is at present supplied with water upon the so-called Holly system; but it is outgrowing the size of its pipes, and it is becoming difficult for the pumps to maintain a sufficient pressure for domestic service in the remote parts of the system, on account of the friction due to the small size of the mains, and the supply for proper fire protection is becoming still more precarious. "There is also a very wide impression prevailing that the amount paid by the city for water rates, fire service and electric lighting, is sufficient to supply the city on a much more ample and liberal scale, and at the same time secure incidental advantages of great value." The project developed in Mr. Frizell's report provides for the construction of a dam on the Colorado River, by which power would be obtained, not only for pumping the needed water supply into a reservoir at sufficient height to maintain a fire pressure on the pipes, but also to furnish power for electric lighting and for propelling street cars, and to give a large surplus that would be available for mill powers. The proposed dam, located about two miles from the city, will be of stone and have a height of 60 feet above low-water level (about 68 feet above bed-rock), a length on crest of

---

[*] Report of Joseph P. Frizell, Civil Engineer, on the proposed dam and water-works for the city of Austin, Tex., and report of Consulting Engineer.

1,150 feet, a top thickness of 16 feet, and will spread out on its lower face in a broad toe or apron, so as to give a horizontal direction to the overflowing water and thus have a bottom thickness of about 50 feet. It is expected that in time of flood 16 feet of water may pass over the crest of the dam.

A reservoir will be constructed 320 feet above low-water level in the river, or 260 feet above crest of dam, and 140 feet above the highest occupied ground in the city, with a capacity of 37,000,000 gallons—half of which only it is proposed to construct at first. A clear spring on the river bank, within 2,000 feet of the pumps, and with a daily flow of 4,000,000 gallons, will furnish an abundant supply of water for domestic consumption for some time to come. Mr. Frizell estimates the ordinary low-water flow of the river at 1,000 cubic feet per second, which would give a continuous net power, delivered from the water wheels, of 5,227 horse-power. By using flash boards to retain the night and Sunday flow (the reservoir behind the dam having a length of from 30 to 35 miles, and an area of about 8 square miles), there would be available for a day of 10 hours, 14,636 horse-power, about one-third more than the permanent power of the Merrimac River at either Lowell or Lawrence, Mass. Reserving 600 horse-power for pumping 5,000,000 gallons daily, and 600 horse-power more for electric light and water-power, there would remain over 13,000 horse-power available for general manufacturing purposes. The estimated cost, including dam and gate house, head race, pump house and plant, reservoir, mains and distribution system, and system of electric lighting, is $1,362,781.

A report by Mr. John Bogart, Secretary Am. Soc. C. E., who was engaged as consulting engineer, is appended. He approves of Mr. Frizell's plans, and of the site selected for the dam, and gives it as his opinion that the dam can be constructed within the estimates given. He sums up the advantages of the project as follows:

"The result of the construction of the proposed dam, with its ponds of pure water, covering some eight square miles, will, in my opinion, be:

"*First.*—The provision to the city, for all future time, of a supply of excellent water in such quantities that it can be used not only for drinking purposes and for safety from conflagrations, but also can be, with considerable profitable return, sold for light power, as for electric light, elevators, etc.

"*Second.*—A lake of pure water, some 30 miles in length and of variable width. This will be a most valuable addition to the attractive features of the city.

"*Third.*—The provision of a water power which will bring great manufactories to the city."

FOUNDATIONS FOR THE CITY HALL, AT KANSAS CITY, MO.

IN a paper on the above subject, read at the Washington meeting of the American Institute of Architects last week, Mr. S. E. Chamberlain explained that the site selected for the city hall was the Market Square, which, a few years ago, consisted of a ravine running diagonally and on both sides of which were abrupt bluffs and hills. Later, the bluffs were cut away and the ravines filled up, making, to the casual observer, a nice plot of ground, but with a fill of 50 feet under about two thirds of the building, and a solid clay bank under the remaining third.

The "fill" was made at different periods with rubbish of all kinds, tin cans, rock, etc., and for some time the ravine at this point was used as a "public dump," making altogether a most unsatisfactory site on which to erect a large building.

The question of foundation for the proposed building was discussed, and the Board finally authorized Mr. Chamberlain to develop some tangible method that would not bankrupt the city nor endanger adjoining property. Piles were generally suggested, but in his judgment that system would be bad in that particular location, owing to the dryness of the earth in the fill and the tendency of piles to dry-rot in such soil. A trench dug in the conventional manner would not only have been very expensive but dangerous.

Mr. Chamberlain finally concluded that a system of piers for the whole substructure would solve the problem, but in this also to dig square holes, or pits, and crib the excavation would have been expensive and dangerous. The cylindrical form of piers was finally adopted, and they were made of uniform size so that the excavation could be done with a large auger operated by steam power and a $\frac{3}{16}$-inch caisson could be made to follow the auger.

This much being decided upon the question of material was taken up. Concrete was the first to suggest itself, but vitrified brick was finally adopted as the materials best suited for the filling of the caissons. These brick singly in a testing machine withstood a pressure of 135 to 140 tons before fracture. The piers are 4 feet 6 inches in diameter, laid in hydraulic cement mortar and grouted solid in each course and well bonded in all directions across. They are sunk to rock-bed of oolite limestone, about 3 feet in thickness, and are capped with cast iron webbed plates on which rests steel I beams all bolted together with standard connections and separators, and the interstices between the beams and the excavation of one foot each side, and one foot under the beams and caps are filled with concrete. The upper surface is capped with boiler plate ¼ inch thick bolted to flanges of beams. On this surface the walls of the building are started. The piers under the north wing, tower and smoke stack, and on each side of the main structure (having excessive weight in addition to the ordinary loads imposed on them) are reinforced by 12-inch "Z" bar columns, which also rest on the rock bottom.

The main principle of the system is the subdivision of the weight, each subdivision being carried by an isolated pier capable of sustaining its own individual load. By making these piers of uniform size the load superimposed on each is made about equal by locating them at a greater or less distance apart.

BROAD-TIRED WHEELS FOR COUNTRY ROADS.

UPON this subject the Scranton, Pa., *Truth* publishes the following:

"In the matter of road building the question of wagons and other vehicular arrangements should be considered. A tired wheel but an inch in width, loaded heavily, will do more damage to a wagon-way than one with the same load tired three inches wide.

"It is a fact that the width of the tire has much to do with the excellence of road beds. This is at present illustrated by the street roller operated by the paving company on our streets. What would a narrow tire effect in leveling the streets? Simply destruction of the streets.

"A heavily-loaded wagon with narrow tires soon ruins the road, and cuts deep ruts. Beside the continual expense of repairing such damages, the wear and tear on the horses and vehicles is great. Upon a smoothly paved street, of course, a narrow-rimmed wheel is all right. But take cobblestone, or wood block, or an earth road, a wide-tired wheel can do more to preserve a good road-bed and a plain, unimproved thoroughfare than anything else. A wide-tired wheel would pound down a good road instead of tearing it up and wearing it full of ruts, and it would not be nearly so tiresome to the horses.

"This is a matter that demands more attention than it has received. Vehicles as well as road-beds should be considered.

"In England the road tax is levied according to the width of the tire, varying from a merely nominal assessment for a wide tire to a heavy tax for a narrow one. It is a wonder that teamsters have not earlier considered this subject, one which must redound to their profit as well as to their comfort."

In a pamphlet on "The Repair and Maintenance of Roads," by W. H. Wheeler, M. Inst. C. E., issued by the Roads Improvement Association, of London, Eng., the author, speaking of the proper width of wheels, says:

"The following proportions have been recommended: ½ to ¾ ton on each wheel, tire 3 inches wide if without springs, 1 inch with springs; ¾ to 1 ton, 4 or 3 inches; 1 to 1½ tons, 6 or 4 inches. A clause proposed to be inserted in any new highway act, that may be passed, requires that all carts weighing over 672 pounds should have wheels of not less than 4 inches width, and vehicles drawn by more than three horses should have wheels of not less than 6 inches width. Wheels of a large dimension do less harm to a road than small ones. Stones will be pushed and moved out of place by the small fore wheels of a wagon, while the larger hind wheels will pass over without displacing them. Large and broad wheels not only do less harm to the roads, but cause less draught for the horses."

In this connection, Mr. W. N. Sweet's suggestion, given in THE ENGINEERING AND BUILDING RECORD for February 9, 1889, will bear repetition. Mr. Sweet there says that all two-horse farm wagons, and others carrying over one ton, should not only be required by law to have their tires 4 inches wide, but that the gauge of the hind wheels should be made 8 inches more than that of the fore wheels, thus diminishing materially the tendency to cut the roads into ruts.

A 1,000-LAMP electric light plant at Gastein, Germany, is operated by power derived from a 120 horse-power turbine, run by the Wildbach waterfall.

WATER HAMMER IN MAIN PIPES.

IN discussing the effects of water hammer on main pipes at the Portland, Me., meeting of the New England Water Works Association, Mr. George A. Stacey, Superintendent of the Marlborough, Mass., Water-Works, said:

"I think the danger from water hammer is something that pertains to the length of the pipe, and the velocity of the water through it. If you take a hydrant right off a large main, and you suddenly shut it, you are only arresting what water is coming from the main into the pipe. If you are running a 6-inch pipe down a mile, and you open the hydrant wide on that end and then shut it down suddenly, you will find you are going to pack the water much tighter than if there was only 12 feet of pipe. I tried an experiment once on 400 or 500 feet of 6-inch pipe, and in shutting the hydrant down from 97 pounds I could very easily get 200. We tried it, also, with shut-off nozzles, and we could get 140 pounds pressure there; it went from 97 to 140 the slowest way we could close the nozzle. Of course we had the elasticity of the hose to take up some of the shock. Up on the main street under the same conditions we wouldn't have got over 15 pounds additional pressure. So I think the danger from water hammer, with the thickness we allow for pipe now, is almost wholly on a long main where the outlet is sufficient to create a high velocity, and when the flow of the water is suddenly arrested. But with any ordinary gate, unless you work pretty quick, I think you would very seldom run the pressure up to the point that the pipe is tested at before it leaves the foundry."

Mr. Clark remarked: "We supply four railroad standpipes. Formerly we had two breaks, one on a 12-inch pipe and one on a 4-inch pipe, on account of the sudden shutting off of the water; but we have an arrangement at the present time which relieves us from the apprehension of any danger. It is a peculiarly constructed valve, partially automatic, so that a plunger in the cylinder rises up with the supply of the water. This plunger is perforated, and the perforations are, perhaps, half an inch in diameter, or smaller than that, making bare one hole after another till it is all open. It takes about three minutes to open it and three minutes to shut it. Since we have had this arrangement, the device of one of our Water Commissioners, we have had no trouble, except in this way, that there is a reduction of the pressure whenever the railroad is taking water. Two years ago, one Sunday, the motors in two of the churches were stopped by the pressure being reduced from 85 pounds down to 50 pounds. There doesn't seem to be any particular shock. I expected there would be a rupture of some of the joints, but the arrangement seems to work satisfactorily."

Mr. B. F. Steben, Manager, Brockville, Can., Water-works, said: "I don't know that any one has had much more trouble than we have had at Brockville, Ontario. We have been supplying the Grand Trunk for five years. They used to take it direct by opening a 6-inch valve, and every time they shut off so quickly our pumps would come almost to a standstill. So I advised our company to put up a tank; but they thought they wouldn't like to do it, they didn't care to spend any money on it. But, finally, about six months ago, the back pressure was so great one day that it broke one of the foundation stones of the engine in the engine-house. You can imagine what a back pressure there was. I told the directors they had better do something at once, or else there would be a very serious result. At last they let me put up a tank that holds 20,000 gallons. It is fed with a 2-inch pipe with a self-acting valve on top, and now the railroad company takes all its water from the tank, and we haven't had any trouble. It works most satisfactorily. The tank is 14x15 feet, and cost $500.

AN ENGLISH WAVE MOTOR.

ENGLISH papers recently described a wave motor designed by A. A. Clarke, of Hackney Road, London, and a working model of which is in operation on the Thames. The designer proposes to apply his system to purposes of ventilation.

The apparatus consists of a floating pontoon, moored so as to rise and fall with the tide, and to the side of which are attached, a little above the line of flotation, open-bottomed cylinders. Each cylinder, at the upper part of its chamber, is provided with two tubes, each fitted with a valve, one with an inlet valve and the other with an outlet valve. The bottom part of the cylinder being open, the waves surge into the cylinder, and force the contained air into and through the inlet valve and tube to be utilized for whatever purpose required, but in the tube fitted with an outlet valve the air is prevented by the closing of the valve from passing onward. On the waves receding and passing away out of the cylinder, the inlet valve is closed, and the air in the outlet tube is forced through the outlet valve into the cylinder to replace the subsiding water. This operation is repeated with each successive action of the waves.

AT a meeting, a short time ago, of the Scientific Association of Meriden, Conn., the sewerage question was discussed at some length. Several papers on the subject were presented.

Correspondence.

Communications giving information or opinions on matters of general interest to the engineer, the architect, the contractor, or the municipal officer, will be welcomed in this column. Fairness will suggest that when communications are sent simultaneously to this and other journals we should be informed of it at the time. Anonymous letters will not be noticed.

WATER WASTE.

ARTESIAN WATER COMPANY,
MEMPHIS, TENN., October 24, 1890.

To the Editor of THE ENGINEERING AND BUILDING RECORD:

SIR: I take the liberty of contributing a few of my humble ideas on some of the questions discussed at the last meeting of the American Water-Works Association, held at Chicago last May.

The question of waste of water has been up at every meeting, and, in my judgment, is one of vital importance to all water companies, both those owned and controlled by municipal government and by private parties. The popular idea that water is as free as air has long since been exploded. We all know, especially those who manage water-works, that every drop of water represents so much cash, although in some rare instances water is obtained from a source that requires no pumping machinery. Still, reservoirs and pipe systems have to be erected and maintained.

Water rates are generally based upon the cost of delivery to consumer, with a reasonable profit to pay an interest upon the investment and cost of management of the plant, and calculations are not made for anything but a legitimate use of the water. Very few cities can, with justice, quote other places as showing that the rates should be changed. There are some places, take "Colorado Springs, Col.," for example, where nothing is necessary but to dam the melted ice, which flows down from the grand old mountain, Pike's Peak, at a height sufficient to give the head desired, and run a main to the city. No machinery is necessary, and but few employees needed to operate the works. Water can be sold at such a place for a small sum. And yet, even there, the habit of allowing same to run to waste is a bad one; for, like everything else in this life, it is much more difficult to correct a bad habit than to acquire one. I am of the opinion that the increase in the demand for more pumping machinery and larger mains in some of our cities is not entirely due to the new uses to which water and water power has been applied, but, in a great measure, to the carelessness engendered by the apparently unlimited supply at hand, and to the fact that it is so easy to leave a faucet running. I may be mistaken, yet am of the impression that two-thirds of the water pumped in our large cities is wasted, and that, even allowing a lavish use for all legitimate purposes, and no waste, few of our cities would find that their machinery and mains were not ample for years to come.

The answer that the introduction of water meters is the remedy, is a good one for *some* classes of consumers, but, I think that for domestic purposes, the privilege of having the supply so convenient to the fixture is to be counted and paid for. Works operated by the city government are not to be made an exception, for the taxpayer is called upon to supply any deficiency in the budget for cost and care of water-works, in addition to rates paid for water. I do not think that the general public have had this matter sufficiently brought to their notice, and consider the majority of our people too honest to knowingly waste or throw away other people's property, as they do, when they tell their servant "Gallagher" to turn her on and "let-ter go," to prevent freezing.

W. L. CAMERON, Supt.

NOMENCLATURE OF CEMENTS.

UNIVERSITY OF ILLINOIS,
DEPARTMENT OF CIVIL ENGINEERING,
CHAMPAIGN, ILL., October 18, 1890.

To the Editor of THE ENGINEERING AND BUILDING RECORD:

SIR: In your issue of October 11, page 299, a correspondent protests against my nomenclature of hydraulic cements. It is a matter of small moment whether others agree with me in this matter, but it is very desirable that there should be more uniformity in the designation of that hydraulic cement which is not Portland. Therefore I ask the use of your columns for a few remarks on the nomenclature of cements, more particularly in answer to your correspondent.

Hydraulic cements may be divided into three classes—viz., Portland, Rosendale, and Pozzuolana. The first two differ from the third in that the ingredients of which the former are composed must be roasted before they acquire the property of hardening under water, while the ingredients of the latter need only to be mixed with water to a paste. The first two classes include the ordinary hydraulic cements, and the third includes the only cements which can properly be called natural cements The first—Portland—differs from the second—Rosendale—in being heavier, slower setting, and obtaining greater ultimate strength. It is the use of the word Rosendale to designate the second class of cements to which your correspondent objects.

Pozzuolana cement is so called from Pozzuoli, Italy, near which place the ingredients of which it is composed were first found. Portland cement derives its name from the resemblance which hardened mortar made of it bears to a stone found in the Isle of Portland, off the south coast of England. There is a great diversity, and some confusion, in the names employed to designate that cement which above is called Rosendale. The terms "natural," "American," "domestic," and "Rosendale" are frequently thus used. The writer proposed, in public print some two or three years ago, to call this cement Rosendale, from the place—Rosendale, Ulster County, N. Y.—where it was first made. With this use of the word Rosendale, cement made in Ulster County, N. Y., would be called Ulster County Rosendale, and that made at Louisville would be called Louisville Rosendale, etc.

In Europe the term Roman cement is employed to designate a cement of about the same character as Rosendale, apparently the only difference being that the former is made from an argillaceous limestone, and the latter from a magnesium limestone. Roman cement is but little used even in Europe, and is not imported. It was first known as Parker's, and was afterwards called Roman, probably on the supposition, or to convey the impression, that it was the cement employed by the early Romans, although it is in no way similar to that cement, which was a true natural cement—*i. e.*, Pozzuolana, as described above.

Your correspondent says: "By long custom the name Portland cement has come to mean any artificial cement, and is firmly fixed in this meaning in literature and in the minds of engineers." There is a so-called artificial Portland cement and also a natural Portland; but, if I am not greatly mistaken, the term Portland is employed to designate a heavy, slow-setting, strong cement, regardless of whether the materials are found combined in the proper proportions naturally, or whether the ingredients must be mixed artificially. Undoubtedly, most of those who use or prescribe Portland cement neither know nor care whether it is "natural" or "artificial" Portland. Of late years the manufacture of Portland cement has been commenced at a number of places in this country. Does your correspondent know whether the ingredients are found already mixed in their proper proportions, or whether they must be mixed artificially?

Your correspondent says that "the most appropriate name for a class of cements the material for which is found in nature ready for manufacture is 'natural cement.'" The term does not seem appropriate. In the first place, any cement which requires roasting before developing the property of hydraulicity, cannot, properly speaking, be called a natural cement, particularly when there are several substances which possess this property without roasting. In the second place, it is doubtful whether there is any cement on the market the ingredients of which are found mixed naturally. One of the marked characteristics of the impure limestones from which any grade of cement is made is a wide variation in composition and position, these variations frequently, and even generally, occurring within very short distances. Probably all the manufacturers of the so-called "natural" cement carefully select the rock from certain strata and exclude that from others, or equally carefully mix different proportions of the rock from different strata. This is certainly done by some manufacturers of "natural" cement. Some of the best of the so-called natural cements are made by combining the different ingredients in the proportions indicated by chemical analysis. In other words, the materials are combined artificially, and, therefore, such a cement is artificial, and, according to the argument of your correspondent, should be called Portland.

The names "American" and "Domestic" are inappropriate to designate the cement under consideration, since both Portland and Rosendale are manufactured in all portions of the country. Your correspondent suggests the names Roman, or Boulogne, as being preferable to Rosendale. The first is the better, since the latter refers to a Portland cement, even though it may not now be on the market. The introduction of an entirely new name, as Roman, would make more confusion than to extend the field now covered by the name Rosendale. According to the U. S. Bureau of Statistics, 40 to 50 per cent. of all the cement of the Rosendale type used in the United States, comes from Ulster County, N. Y., all of which is universally called Rosendale, even though only part of it comes from the village of Rosendale. The appropriateness of the name is shown further by the fact that the natural bed of limestones from which the original Rosendale is made, covers about one-third the State of New York, and the western part of Vermont, besides extending in a belt through New Jersey, Pennsylvania, Maryland, Virginia, and East Tennessee.

Your correspondent intimates that the writer's use of the term Rosendale leads to "confusion, or want of meaning," because this class of cements vary greatly in activity. If we follow your correspondent and call it natural cement, will the variation be any less?

IRA O. BAKER.

ACCORDING to the Los Angeles, Cal., *Mirror*, W. T. Spilman, who built the Los Angeles and Pacific Railroad, has secured a large contract from Barber & Co. Mr. Spilman will build a dam in the San Fernando Valley, near Santa Susanna Pass, 50 feet high, which will make a reservoir with a water surface of 130 acres. This dam is being built in connection with one already constructed higher up in the same cañon. The object is to have two reservoirs, one of which will be a storage reservoir and catch the surplus water from the higher one. These two reservoirs will furnish water with which 25,000 acres of land can be irrigated.

Novelties.

Devices are described under this head purely and strictly as news; because believed to be new and calculated to interest readers.

In no case is pay accepted, directly or indirectly, for publishing a novelty notice.

As the subjects are selected for their supposed novelty and interest merely, it will, of course, be understood that the selection does not imply indorsement.

ELECTRIC ELEVATORS AND HOISTS.

THE American Electric Elevator Company, 15 Cortlandt Street, New York, are putting on the market an electric elevator outfit, electric pumps and an electric dock hoist. Of two of these specialties illustrations are given on page 347.

Compactness is one of the important claims made for the elevator combination. The average size of the electric outfit is claimed to be such as to occupy a floor space of but 6 by 4 feet, and a height of about 4 feet. Owing to the small space occupied and the absence of vibration, the machine can be placed at the top of the elevator shaft, so that it is entirely out of the way, occupying no space which is of value for other purposes. When the machine is so placed, the car is lifted direct from the drum, no sheaves being required. This necessitates a specially grooved drum so made that as the lifting cable winds and unwinds on the drum the pull on the car is always in a vertical line.

The outfit consists of the electric motor, worm geart drum, reversing switch and rheostat combined, automatic electric brake and automatic stop device for stopping the elevator at the top or bottom of the lift, thus making it impossible for the elevator car to travel too far in either direction. The armature shaft of the motor is coupled direct to a worm shaft, and this coupling is also a brake wheel, to which the brake is applied automatically when the current is cut off, and thus not only serves the purpose of overcoming the momentum of the armature when stopping, but also serves to hold the car stationary, if, through accident at the generating station or from any other cause, the current should be cut off. The worm actuates a worm gear which is attached to the drum shaft. On the drum shaft, but not attached to it, is the wheel to which is attached the operating rope, the movement of which starts, reverses or stops the car at the will of the operator. The end of the drum shaft has a screw thread, and on it travels back and forth a nut which has wings, and which, when it meets with any obstruction, turns with the drum shaft, and is so attached to the operating wheel by means of the wings that it turns the wheel just enough to stop the motor. The necessary obstructions to the travel of the nut are in the form of collars, which are fastened to the shaft at just the right place to stop the machine at the top and bottom of the lift. The whole is assembled on one bed-plate.

There is claimed to be none of the noise and disagreeable jerking of the car noticed with some of the belt and spur gear machines. The electric motors are of a slow speed type, made especially for elevator service, which enables the coupling of the worm shaft direct to the armature shaft and yet permits running the worm at a sufficiently slow speed to insure quiet and smooth running. The worm runs in an oil cylinder, so that worm and worm wheel are constantly lubricated.

The armature shaft and worm shaft are fitted with automatic oiling bearings. The worm, which is of one piece with the worm shaft, is made of hard machinery steel and the worm gear is a bronze composition ring securely fastened on a cast-iron web. The bronze composition being much the softer metal, gets all of the wear, and when worn out can be readily renewed at a small cost.

An important point about the direct-connected electric machine is the economy of electric current. As the motor runs only when the elevator is in actual motion, no current is used during the time the elevator is standing. Another important point is the fact that while you have a motor capable of developing 5, 10, 15 or 20 horse-power, as the case may be, it actually develops only the power required at the moment.

The company recommend their direct-connected machines for high speed passenger elevators, or for any elevator in which smooth running and the greatest economy are results to be obtained; but in some cases, where there is a line of shafting available, driven electrically or otherwise, they are prepared to furnish belt elevators of their make. In these the drum is driven by worm gear like in the direct-connected machines, but the worm shaft instead of being coupled to the armature shaft of a motor has one fast and two loose self-oiling pulleys. This shaft is also provided with an automatic strap brake to hold the load stationary when at rest, and to render the changes of motion prompt. This machine, like the direct-connected machine, is provided with an automatic slack cable stop to prevent unwinding of the cable if the car should be obstructed in its descent, and an automatic stop, independent of the operating rope, for top and bottom of lift.

Figure 1, of the accompanying illustrations, illustrates the elevator arrangement.

A general view of an electric dock and ship hoist is shown in Fig. 2. A vertical section explaining the arrangement more clearly is given in Fig. 3. The apparatus consists of an electric motor coupled direct to the armature shaft, on which, as in the case just described, is a worm shaft and worm. The latter, as before, actuates a bronze worm gear D, and cast-iron friction clutch E, which is attached to a solid steel shaft F, to one end of which is attached a hauling drum or winch-head G, and on the other end of which is cut a thread. On this thread is a cast-iron hand-wheel nut H, which is supplied with steel handles on the inside of the rim, so placed in order that they will not catch in the clothing of, or strike the operator, and the movement of this hand-wheel nut forces the loose drum I into contact with the friction clutch E, or withdraws it at the will of the operator. The worm also runs in an oil cylinder J, and the worm gear is inclosed in a cast-iron casing K, which forms a bearing for the drum shaft F, and the standard L, which carries the other end of the drum shaft, also carries the switch M, and the switch lever N. The switch is completely inclosed in a cast-iron box O, which excludes all dust and dirt, and prevents the possibility of anybody coming in contact with it. The rheostat, or resistance box P, is placed within the bed plate, and the connections are so made that there are no wires in sight, and injury to the wires will not readily happen.

The operation is as follows: The operator moves the switch handle N to the left, which completes the electrical circuit and starts the motor. As he continues to move the lever to the left he cuts out more resistance until full speed or the speed desired is attained. The drum-shaft, winch-head and handwheel-nut are now in motion, but the drum is still at rest. The winch-head G alone may now be used if desired, but if it is desired to use the hoisting-drum I, the operator places his hand upon the hand-wheel H and holds it stationary. This has the effect of screwing the wheel against the hub of the drum I which is thus forced into contact with the friction clutch E, and when the pressure is sufficiently great to enable the drum to hoist the load, the operator is no longer able to hold the wheel, which then turns with the drum until the load is lifted to the desired height. The machine is then stopped by throwing the switch lever back to a vertical position, thus breaking the circuit and stopping the motor. The worm gear now holds the shaft with the friction clutch stationary, and the possibility of the worm being driven by the load is prevented by an automatic brake Q on the worm shaft The hand-wheel H is connected with the hub of the drum I in such manner that, while each can turn independently of the other, the drum is moved back and forth on the shaft, as the wheel is turned on the thread. To lower the load the operator moves the wheel H so as to withdraw the drum I from the friction clutch E until the load begins to descend by gravitation, and the speed of the descent is governed by the hand-wheel.

In the electric pump outfits of the company, centrifugal pumps are used. The outfits are compact and applicable to a variety of pumping purposes.

The electric motors are made by the Thomson-Houston Electric Co., and the other accessories are made by the Trenton Iron Co.

LOSS OF THE DREDGE "DE LESSEPS."

THE Nicaragua Canal Construction Company has received a dispatch from Colon announcing the loss of its steam dredge, the "Count De Lesseps," about two weeks ago, while being towed in the Caribbean Sea along the coast from Colon to Greytown. It was learned that the "De Lesseps" had been sent to join five other similar vessels belonging to the company which are lying at Greytown. The "De Lesseps" started on October 18, in tow of the steamship "River Mersey," commanded by Captain Morton, an experienced navigator, and after having been some time under way encountered rough weather. The dredge carried a tower 60 feet high, and its oscillation, owing to the rocking of the vessel, is supposed to have opened her seams, causing her to leak badly. The motion of the tower disabled the steam pumps, which could not be operated, and the vessel filled rapidly and sank. The "De Lesseps" was 100 feet long and of 60 feet beam, drawing about eight feet of water. She could excavate a channel 30 feet deep and deposit dredgings at a distance of 160 feet on either side. Her monthly capacity was about 150,000 yards of earth. She was built for the American Contracting and Dredging Company, in Philadelphia, in 1882, by Slaven Bros., and cost, delivered at Colon, $175,000.

DOMESTIC PLVMBING HEATING LIGHTING & VENTILATION ENGINEERING

ELECTRIC MOTORS.

(Continued from page 332.)

THE U. S. ELECTRIC LIGHTING COMPANY'S MOTOR.

The latest improvements in the line of motors made by the United States Electric Lighting Company, 120 Broadway, New York, are shown in Figs 20, 21 and 22.

Figure 20 represents the type of motor designed for from $\frac{1}{16}$ to 20 horse-power. Its symmetry, solidity and simplicity are features to which attention is drawn by the makers, and its special features of construction are outlined as follows: Its contour is such as to practically protect all vital parts from accidental, mechanical injury. The field is made in the shape of a horse-shoe, cut in the center and fastened together by bolts. There is but one field coil wound upon a movable spool. This construction makes but one joint in the machine and renders the removal and replacing of the field coil very simple.

The armature is built up of disks of decarbonized steel. These disks are firmly secured to a steel shaft. The coils and bands, instead of being upon the surface of the armature, as is usual, are entirely below it. This is claimed to allow the safe running of the armature very close to the pole-pieces, thus largely reducing the amount of wire necessary, and consequently, the armature resistance; furthermore, the coils are thus entirely protected from any mechanical injury. The winding of the armature and the proportion existing between it and the field are such as to give a fixed point of commutation, thus overcoming the necessity of changing the position of the brushes on the commutator, however the load may vary, and entirely avoiding a spark.

The commutator is made very heavy, of pure copper strips insulated by mica. The brush holder is extremely simple and rigidly attached to the frame, as there is no necessity for changing the position of the brushes. It is made of brass, insulated from the yoke piece, carries copper brushes, and cannot be placed in any but its proper position. The form of machine permits of perfect alignment of the bearings, which are made of special hard bronze.

The motor is mounted on a cast iron base, where its size makes it desirable, either with or without legs, and is provided with a belt tightener. It is insulated from the base by hard wood blocks. The starting and stopping device is located on the motor itself and in high potential motors is inclosed in a glass case, thus avoiding any contact with parts in circuit.

The regular range of sizes of the motors made by the U. S. Electric Lighting Company extends from 1 to 150 horse-power, though special, smaller sizes, as above intimated, are also made. At present, the company are furnishing motors to several large manufacturing establishments for various purposes, such as operating cranes, testing machine tools, etc. Among these establishments are the Pond Machine Tool Works, at Plainfield, N. J.; the Baldwin Locomotive Works, at Philadelphia, Pa.; the Pennsylvania Railroad Shops, at Altoona, Pa., and E. P. Allis & Co., of Milwaukee, Wis.

(To be continued.)

CORK COVERINGS FOR STEAM PIPES.

According to the Manchester, Eng., *Mechanical World*, M. Lecouvre has recently presented a report to a French society on the effect of cork coverings for steam pipes, which are more extensively used in France than here, both for steam pipes and as a protection of water service pipes against frost. There are two sorts of such coverings in use. One of these consists of pieces of cork shaped to fit the different sizes of pipes with radical joints, similar to the staves of a barrel, which are placed around the pipe and provisionally bound to the pipe by strings. After the pipe so covered has been used with steam for some time, and the cork been sufficiently dried, the crevices are filled in and the string is replaced by wire. Elbows are covered in the same manner. After the covering is finally fixed, it is advisable to close the pores and crevices by a coat of paint or lime wash. In the other system rectangular blocks of cork about 1¼ inch wide, and varying in thickness from ¼ inch for small pipes to ⅝ inch for pipes from 4 inch diameter upwards, and cemented to strips of cloth by an India rubber solution, are used. These bands are lapped spirally round the pipes and elbows, and covered by another band of water-proofed canvas lapped in the same manner so as to cover the joints of the cork bands, the whole being afterwards covered by a thick coating of paint or tar. Experiments with both of these coverings have been made at Creusot by M. Ch. Campere, engineer of the Paris Steam Users' Association, in a careful manner. The apparatus employed consisted of two inclined pipes communicating at the top with the steam supply, and at the bottom with a steam trap. One of the pipes was uncovered, and the other covered by the material, the effect of which was to be tested, the surfaces of the pipes, which were without flanges, being in each case a square meter. In these trials a cast iron pipe 10 inches in diameter, covered with cork, showed an economy of 38*s*. per square yard of surface for 300 days of 12 hours, assuming the coal used to cost 20*s*. per ton, and to evaporate 7 pounds of water per pound of coal. With a copper tube 6½ inches in diameter the saving amounted to 31*s*. under the same conditions.

STEAM HEATING IN A SIXTY-SEVENTH STREET RESIDENCE, NEW YORK.

The large four-story and basement house at No. 7 East Sixty-seventh Street, New York, was originally provided with heat from a hot-air furnace. Recently this furnace was discarded and the house heated by indirect steam radiators so arranged as to utilize the old hot-air flues and ducts and involve no changes, rebuilding, mason work or piping above the cellar, and only the addition of simple apparatus there.

Figure 1 is a plan of the cellar, and is not drawn to scale, but merely shows the arrangement and location. A and B are the old brick furnace chambers, which, with their smoke-pipes D and D′, are left intact, except that a few lengths of D′ are unjointed for convenience; C C, etc., are the old hot-air ducts to the wall flues E E, etc., and F F are the old fresh-air inlets, all left undisturbed.

For the reconstructed system new inlets were made at G G, through which fresh air is admitted to filter chambers H H, and thence taken, through ducts I I, to brick chambers J and K, each about 7 feet high and 4x7 feet square inside.

These chambers contain steam radiators, and the air, after being heated by them, passes into the distributing boxes L L, which communicate by branches O O O, etc., with the ducts C C, etc., and thus distribute the hot air as in the old system. The steam used is supplied from the mains of the New York Steam Company, but as excavations in the street at this point are prohibited for a certain number of years the supply was branched from the connections in the adjacent house and is received through the 1¼ inch pipe M; N is a 1-inch drip-pipe, and P P are steam traps; Q Q, etc., are dampers automatically controlling the hot-air supply by the Johnson heat regulating system, which was illustrated and described on pages 156 and 171; T is the air-pump operating the electro-pneumatic valves in case S that, through the air-pipes R R, etc., control the damper valves (not shown here) at Q Q, etc., and the steam valve U. The latter is closed as soon as all the rooms in the system are at the required temperature, and is opened as soon as any one of them falls below it. V is a globe valve for controlling the steam supply by hand. A regulating valve, not shown, reduces the pressure to any required amount.

Figure 2 is a perspective view from Z, Fig. 1. The same reference letters have the same meaning there as in Figs. 1, 3, 4 and 5. Figure 3 is a horizontal section through *m m*, Fig. 2, and Fig. 4 is a vertical section at *w w*, Fig. 3; Fig. 5 is a view of the interior of chamber K.

Steam from pipe M is delivered to radiator *d* and returns, with the condensation water, to trap P. This steam, together with that from pipe N, is supplied through pipes *y* and N to the secondary radiator *g*, Fig. 5 (in this case a Gold extended surface radiator), designed to utilize most of the remaining heat and discharge the condensation water at a comparatively low temperature into the sewer through the drip-pipe *p*; *a* is a draw-cock, *b* a manhole giving access to chamber K, and *c* an automatic air-valve. As shown in Figs. 3 and 4, the elbows, which connected the old flues *c c*, etc., to the vertical branches *p p*, etc., of the old furnace, were replaced by tees S S, etc., which join the flues C C, etc., to the branches O O, etc., from the distribution box L, and the vertical pipes *r r*, etc., were closed by the stoppers *t t*, etc., thus entirely cutting out the old furnace but leaving the connections so that it could be quickly thrown into service again if necessary.

In Fig. 5 *f* is a pipe frame supporting the radiators *d* and *g*; *d* is the standard Evan's radiator, one end of which is shown in section in Fig. 6. It consists simply of a hollow cast-iron box *h*, with inlet *j*, outlet *k*, and air-pipe *l*. The radiator pipes (in this case about 300 pieces, 1 inch in diameter and 4½ feet long) are simply Bundy loops screwed into the sides of box *h*, with a pitch of about 1 in 10.

Figure 7 shows the filter air closet H, which is a tight cell, about 7 feet high and 5 by 7 feet square, reaching from the floor to the ceiling, built of matched pine stuff and lined with tin. A folding screen is made considerably longer than the closet and just as tall as its inside height. It is then partly opened and the ends hooked to the walls at *v v*, etc., so that its half-opened panels *q q*, etc., that are covered with fine cheese-cloth *u u*, etc., make a zig-zag barrier through which all the cold air from inlet G is filtered before entering the 2-foot galvanized iron duct I. When the screen becomes dusty it can readily be removed, cleaned and put back in place by any servant.

Figure 8 shows the Johnson air pump for compressing the air that operates the pneumatic valves. Figure 9 is a diagram (not drawn to scale or exact detail) illustrating the operation of the pump. The latter consists essentially of two cast-iron shells G G, about 12 inches diameter, each containing a rubber diaphragm H, connected to rod O; F is the pressure pipe with check valves E E opening upwards; D D are air inlet pipes which can be closed by stopper N; B is the delivery, and M the discharge water pipe, and L L are their branches, controlled by the four-way rotary valve K with lever Q.

Figures 8 and 9 show the pump nearly at the end of the right hand stroke. Water is entering the left hand chamber J, and is forcing air out of I into F, while on the right hand the check valve E is closed and air enters I as the diaphragm H moves to the right, and expels the water from chamber J through branch L to waste pipe M. At the end of the stroke the link P, fixed to rod O, will throw lever Q into the position shown in Fig. 8, thus shifting the stopper M to N′. This opens the left, and closes the right hand air inlet D, and also rotates valve K in direction R so as to reverse the water currents in branches L and L. Water will, therefore, be admitted to the right hand chamber J and expelled from the left hand one, and air will be expelled from the right hand chamber I through valve E, and admitted to the left hand chamber I through its pipe D. When the diaphragms reach the positions H′ H′ the valves again reverse, and so on.

The steam heating in this house was designed and constructed by the Q. N. Evans Construction Company of New York, and the automatic regulating system was put in by the Metropolitan Electric Service Company, also of New York.

RELICS OF ANCIENT ROME.

THE *English News* states that the commission in charge of the improvement of the City of Rome has unearthed great quantities of lead water-pipe, each plainly stamped with the name of the owner of the house, the year of the plumbing, the name of the consuls for that year, and that of the reigning emperor. In opening the 82 miles of new streets in that city, material has been found sufficient to add to our present knowledge a thousand details concerning the baths, heating flues, water pipes and house sewer pipes, the organization of the police and fire brigades, etc.

REFERRING to the recently published paragraph that New York is shortly to have a steam heated wharf, and that the only other one in the country is at Boston, Mass., a Boston correspondent writes that this latter establishment is the warerooms of the Boston Fruit Company, the building being heated by hot water circulation, and a Gurney boiler being used. It is said to give a very even temperature and to admirably suit the purposes for which it has been adopted.

Questions and Answers.

All questions relating to building construction, paving, sewerage, water supply, or kindred subjects, will be welcomed in this column provided they relate to matters of general interest and are not such as should properly be referred to a consulting engineer. Answers will be carefully prepared and a proof of both question and answer mailed to the inquirer as early as proper consideration will permit. They will be published for the benefit of other readers as soon as convenient. The full name and address should be given, not necessarily for publication, but as a guarantee of good faith, and to facilitate further correspondence in case the question is not sufficiently explicit.

Inquiries of the Editor, in order to secure prompt attention, should *not be written on the same piece of paper as a communication* to the *Publishing Department.* Letters renewing subscriptions are sent to a clerk in the publishing office, and matter for the Editor, if in the same enclosure, is likely to be overlooked unless it is on a separate piece of paper, so that it may be promptly sent to the Editor.

COPYING DRAWINGS IN COLORS.

IN response to an inquiry from Joliet, Ill., for particulars of some quick process of copying drawings in all colors, we would say that the only device which we know of, designed to accomplish this purpose, is the hektograph. From what we have seen of the work done with it the device would seem to be well adapted to our correspondent's requirements. It is in use in many architects' and engineers' offices for all kinds of copying work. In all cases a specially prepared ink must be used. This can be obtained in various colors from the makers of the hektograph, The Hektograph Manufacturing Company, 82 and 84 Church Street, New York.

Notes and Queries

on Domestic Engineering.

Communications relating to the practical details of plumbing, heating, lighting and ventilation will be welcomed in this column. The writer's true name and address must always be given, but an assumed name may be used for publication if preferred.

SUBSOIL DRAINAGE OF HOUSE FOUNDATIONS.

THOMAS LLOYD BETTON, of Kansas City, Kans., writes: "Please find inclosed a plan of foundation for a building, with drain tile running around foundation. Tile is hubless, such as is used on farms for draining farm land. It runs about eight inches above footing and the architect wishes us to connect same to sewer, which has to convey water from two water closets, two washstands, two bath-tubs, two sinks, as you will see it shown connected in our plan. We say it is not proper to connect it to main sewer, for in case trap should become stopped up in any way everything from house would be forced back into the hubless tile, and would be the means of saturating the ground around building before it would be discovered. Please give us your opinion as to whether the tile should be laid above or below footing."

[Two-inch cylindrical land tiles with slip collar joints should be used, with Y branches and curved pieces for change in directions. The tiles should be placed on a plank bottom laid to grade of about 6 inches in 100 feet. The invert of the tile should be level with the bottom of the footing course at the front of the house (or at the point of discharge of the tiles), and should rise in both directions from this point to a "summit" at the back (or opposite side) of the house. Care should be taken to prevent mud from flowing into the drains while being laid. The joints in the tile are sometimes made with cloth or tar paper wrapping instead of slip collars. It is a good plan to fill in the trench with broken stones to a depth of 6 inches over the pipe and to cover this with salt hay or straw before filling in the earth. The outside wall of the house should be thoroughly plastered and troweled smooth with Portland cement mortar (1 to 2) and allowed to set before the tile is laid. This plaster coat should extend from an inch or two above the surface of the ground to the bottom of the footing course. A coating of bitumen laid on hot outside of this will make the foundation walls doubly proof against water and dampness. The discharge from the subsoil drains should not connect with the sewer if it can be otherwise disposed of. In case it is impossible to provide other means of draining the subsoil line, it may connect with the house sewer under the following conditions:

First.—It must be independently trapped against the entrance of drain air.

Second.—The trap must be supplied with water from an unfailing source, and had best be connected with a rain leader or yard drain. The ground water supply alone should not be relied on to furnish seal for the trap, as during dry seasons the subsoil drains may carry no water.

Third.—The subsoil drains should be effectually trapped against the back flow of sewage, which may be occasioned by a stoppage in the main drain beyond the junction of the subsoil line. For this reason it is, perhaps, best to connect the subsoil line on the sewer side of the house drain; as stoppages in the main house trap, which are not infrequent, would not then affect the subsoil line. The prevention of the back flow of sewage must depend on some mechanical trap, which is always to be deprecated, as no mechanical trap is reliable; and it is for this reason chiefly that the connection of the subsoil drains with the house sewer is to be avoided if possible. For the purpose in view a mechanical trap with a floating ball is preferable to flap valves and metal balls seating downward, as the floating ball is less liable to fail to seat itself. A failure in the operation of the mechanical trap, in case of stoppage in the house sewer beyond the subsoil junction, will result in flooding the subsoil drains with house sewage which is not liable to be discovered until some of the house fixtures fail to operate properly or until the flooded subsoils become offensive. This is a risk which cannot be overcome, and it is essential, therefore,

Fourth.—That the traps be located where they can be frequently and readily inspected and cleaned.

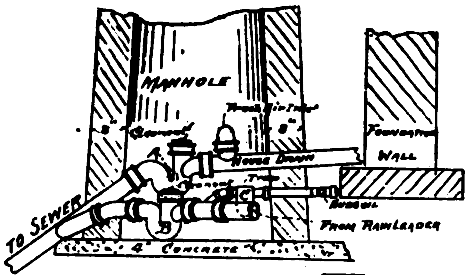

FIG 2

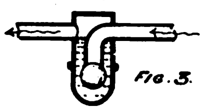

FIG. 3.

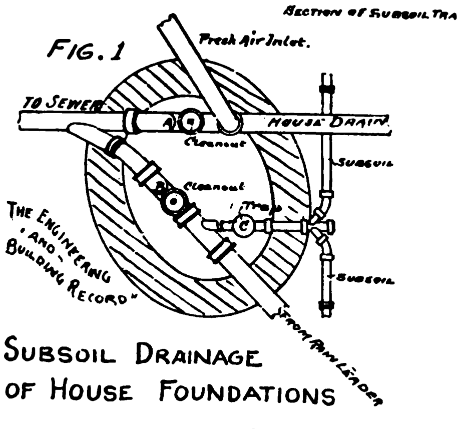
SECTION OF SUBSOIL TRAP

FIG. 1



A convenient arrangement of traps to cover the points enumerated is shown in Figs. 1 and 2, in connection with which it will be noted that, when working properly, the trap B is supplied with water from a yard drain or rain leader. The trap C, Fig. 3, is a ball float mechanical trap allowing the subsoil water to flow into B, but preventing back flow of water or sewage when the ball is seated. A patented trap of this general pattern is in the market. If C runs dry, B prevents the back flow of drain air, and, in case of the back flow of sewage, the first entrance of sewage into C would float the ball and seat it. The rain leader should be carried up with iron pipe and tight joints to the height of the fresh-air inlet, or above the level of a yard drain, so that sewage backing into the leader may not escape until it has found its way out at some opening, where it will be a nuisance and be brought to the attention of the householder.

The traps, as shown in the drawing, can be grouped in an oval manhole 4x3 feet.

From what has been said it is evident that you were right in saying it would not be proper to connect the subsoil drain as shown in your sketch. The correct method of laying the tile has been indicated. If laid *below* the footing course, it may undermine it and crack the wall; if laid above the footing course it is not draining the subsoil to the greatest available depth.]

THE Dallas, Tex., plumbers' association has passed a regulation by which no plumber can take a sub-contract. They contend that contracts for work in their line must come direct from the party having the work done.

NOTES ON SEWER INSPECTION.

WE have received a pamphlet, issued by a firm of plumbers in Illinois, which is very good reading, as will be seen by the appended extracts. The orthography and the grammar may be a little shaky, but there is no room for doubt as to the author's meaning.

"A poor, inexperienced inspector on a sewer is of no value to a city, all from the fact that if a contractor has one or more expert sewer men around his job they will beat this so-called inspector right along; then the contractor makes the city accept the work, because the inspector said it was all right, and of course he don't know anything about it, and the pipe setter and the foreman beat him in every point, not because it is any advantage to them or the contractors that they work for, but just to make a fool out of a crank; and I will state that when any city employs a man to inspect any city work who is not a safe, industrious mechanic, they are only wasting money, because any man who drinks to excess can be brought to hold his tongue while contractors rob the taxpayers to suit themselves—such is generally the case; but, if first class mechanics cannot be had, then it is best not to have any at all, because the contractor will always do a much better job, because he has no reason to either cheat or vary from his contract. We will say that the grade line has been established and the contractor ready to begin, the engineer, if he has anything else to look after, such as whiskey to drink, will need a competent and reliable inspector, who cannot be led off to some saloon or place of pleasure every ten minutes, but will stay on the ditch every minute that the work goes on, to see that the sewer is actually laid as it should be, and to see that the materials are what have been agreed upon, and upon this some inspector rests a large part of the burden of securing an excellent piece of work. * * * Poor sewers are a boon to doctors and undertakers, while they are a ruin to those who live close by them, and also to the taxpayers. All those things you will find to be true when you have a poor sewer connection in your house and typhoid and malaria fever carries off the dear ones of your heart. * * *

Main Sewer

"Every city should have a man in charge of their sewers who was an expert, and a man not afraid of mud and water, that has a place of business, and could sleep right by his telephone, so that if anything happened in the night he could be had at once; and in case of heavy storms he should be out on the line continually, until the storm is over, to see that the grates are all clear and not overflowing in some cellar, to cause the city to be sued for damages. This man should be one who is properly fixed with all the necessary conveniences to open up and curb a line on short notice, day or night, and fully understand his business, stay sober, and be ever at his post; if a man does not do this, then he shall be discharged, and a good man put in his place, if such can be had.

"No so-called expert should be employed in this position because he spends his money with some particular member of the City Council, or some one that has the appointing of him. The people at large, whose property and lives are held in the grip of this same Inspector of Sewers, should have something to say about this, and the taxpayers will find that some man of this kind will generally have the place if they do not look after it; whether he has ever done a day's work in his life, or ever seen a sewer, he must have the place, because he spends his money with some official above him; no matter if he is drunk or sober, asleep or awake, if he spends his money this way he holds his position, and the taxpayer has to suffer all kinds of nuisance and still pay on and on for nothing."

A TUNNEL between Ireland and Scotland is at present being discussed. According to one of the proposed plans the tunnel would be 33 miles long, and its greatest depth 500 feet.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

THE ENGINEERING AND BUILDING RECORD,
277 Pearl Street, New York.
November 1, 1890.

CONTRACTING INTELLIGENCE.

For works for which proposals are requested see also the "Proposal Columns," pages i-ii-353.

WATER.

For Additional Water Items see Proposal Columns.

Manchester, N. H.—With reference to the proposed addition to the system of water-works of this place, the report of the engineer, M. M. Tidd, of Boston, has been accepted by the Water Board, who voted to have it printed and to submit the matter to the city government for further action.

Alliance, Neb.—A system of water-works, to cost $20,000, is to be established at this place. Plans, etc., are now being prepared by A. A. Richardson, of Lincoln, Neb., who will furnish particulars.

Canton, S. D.—Engineer A. A. Richardson, of Lincoln, Neb., is now engaged getting up plans for $21,000 water-works for this city. For further information apply to him, as above.

Quincy, Ill.—Plans and estimates are now being made for a complete system of water-works for this place.

Sturges, S. D.—This place is to have a complete system of water-works at once.

Martinsville, Va.—Reports say that the projected water-works for this place will be established at once.

Seymour, Tex.—It is proposed to establish a complete system of water-works at this place. Address Morgan Jones, as above, for particulars.

Hebron, Neb.—Owing to the delay in getting specifications to bidders, and from the general dissatisfaction by contractors and manufacturers at the short time in which to bid intelligently, the Council, at the urgent request for more time, have decided to hold open for the receiving of bids until November 5, no bids having been opened.

Menasha, Wis.—C. C. Garland, of Minneapolis, Minn., writes: "There is nothing being done in the way of water-works at Menasha, Wis. My proposition has been withdrawn."

Aberdeen, Wash.—City Clerk J. H. White writes: "At the election held here October 7 the people decided in favor of establishing a system of water-works."

Cisco, Tex.—The Superintendent of the Cisco Water Company writes: "Charter obtained to supply this town with water; supply to be got by damming a canon; 145 acres of ground bought. Engineers to make proper estimates, etc., for dam, stand-pipe, engine, pipes, etc. Capitalists ready to invest $50,000, at least that much subscribed."

San Angelo, Tex.—It has been decided to lay seven additional miles of water mains. Address J. I Millspaugh for particulars.

Centralia, Wash.—The engineers have about completed surveys of the water-works and work will be begun at an early day.

Ironwood, Mich.—A system of water-works, to cost $100 000, is to be established at this place by the Ironwood Water-Works Company.

Kirkwood, Mo.—The company organized to establish water-works at this place will, it is understood, begin operations at once.

Jamesville, Mass.—This place is to procure a water supply from Worcester. The necessary mains, etc., will be laid at once.

Benton Harbor, Mich.—It is proposed to expend the sum of $100,000 on a water-works system for this place.

Oakland, Cal.—The Blue Lakes Water Company will soon be ready to begin work, nearly all of the stock necessary having been already subscribed. This company, in addition to supplying water for Stockton and Oakland, will furnish power to operate electric light and power plants.

Bay City, Mich.—It has been decided to settle the question of expending the sum of $50,000 for improving the water-works system by the taxpayers, who will vote for or against the project at the election next month.

Union City, Wash.—The water-works system of this city is to be increased by the addition of numerous branch lines.

Cranford, N. J.—It is expected that the water company recently organized at this place will soon begin the construction of a system of water-works.

Key West, Fla.—Numerous additional water mains are to be laid in this city. Address President Maloney, of the City Commissioners, for particulars.

Dayton, O.—Important water main extensions are to be made in this city.

Belleville, Ill.—The City Council has authorized Mayor Rainey to appoint a committee of three of its members "to confer with the Board of Trade, manufacturers, millers and business men generally in reference to the proper steps to be taken to secure an ample supply of good, pure water." This committee, consisting of Alderman W. T. Crouch, Geo. Krug and E. S. Winkle, met with the Board of Trade in the County Treasurer's office, October 27, to discuss the water question, and it is thought that a strong home company will soon be organized, and a supply of water insured by bringing it direct from the Mississippi River above East St. Louis.

San Jose, Cal.—The San Jose Water Company has increased its capital stock from 7,000 to 10,000 shares of $100 each, and extensive improvements will be made at once.

Zanesville, O.—J. W. Hill, C. E., of Cincinnati, O., has recommended that the sum of $175,000 be expended on the improvement of the water-works system at this place. The people will vote on the question of issuing bonds for that purpose at the coming election.

San Francisco, Cal.—The American Land and Water Company has been incorporated here by Timothy F. McCarthy, Edwin Windele, and others. The capital stock is $200,000.

Elgin, Ore.—The Elgin Water-Works Company has been incorporated at this place, and a plant will be established. For particulars address J. W. Snyder, as above.

Davenport, Iowa.—The Davenport Water Company has decided to establish a filter system in connection with its plant.

Water-Works.—See our proposal columns for information regarding water-works and water-works furnishings at the following places: Rushville, Ind.; Philadelphia, Pa.; San Angelo, Tex.; Ellsworth, Kan.; Galt, Ont.; Columbus, O.; Chambersburg, Pa.; Harrison, O.; Chester, S. C.; Chamberlin, S. D.; Huron, S. D.

SEWERAGE.

For Additional Sewerage Items see Proposal Columns

Atlanta, Ga.—Extensive sewer work is to be done in this city. Address the City Engineer for particulars.

Akron, O.—The construction of a storm water sewer is projected at this place.

Belfast, Me.—The question of introducing a system of sewerage at this place is being discussed by the local officials.

St. Louis, Mo.—Extensive street improvements are to be made in this city.

Babylon, N. Y.—There is a project on foot at this place to establish a system of sewers. The Town Clerk can furnish particulars.

Oakland, Cal.—Considerable new sewer work has been authorized at this place.

Trenton, N. J.—Numerous sewer extensions are to be made in this city. Address the Clerk of the Board of Water Commissioners, as above.

Haverhill, Mass.—The Board of Aldermen has authorized the construction of numerous additional sewers at this place.

Salem, N. J.—The local officials are considering the question of putting in a sewer on West Broadway. T. J. Yorke has been authorized to consult Colonel Waring on the subject.

Hamilton, Ont.—Numerous sewer extensions are to be made at this place.

Oakland, Cal.—The order approving the system of sewerage for the Point Lobos District, as proposed by City and County Surveyor Smith, has been passed by the Supervisors.

Sewers.—See our Proposal Columns for information regarding sewer construction at the following places: New York, N. Y.; Victoria, B. C.

BRIDGES AND IRON STRUCTURES.

For Additional Bridge Items see Proposals Columns.

Saco, Me.—Mayor Enoch Lowell writes: "Contract was closed October 8 with Berlin Iron Bridge Company, East Berlin, Conn., for a wrought iron deck truss bridge, length 50 feet, roadway 68 feet, for the sum of $3,750."

St. Paul, Minn.—The following bids for constructing the superstructure of the bridge on Sixth Street were received by J. T. Kerker, Clerk of Board of Public Works, October 23: Milwaukee Bridge and Iron Works, Milwaukee, Wis., $135,951; Chicago Bridge and Iron Company, Chicago, Ill., $148,000; Chicago Forge and Bolt Company, Chicago, Ill., $128,875; Keystone Bridge Company, Pittsburg, Pa., $136,000; The New Jersey Steel and Iron Company, Trenton, N. J., $135,900.

Dayton, Tenn.—The Tennessee Industrial Land Company, of this place, will build two iron bridges over railroads.

Hancock, Ind.—The Hancock Bridge Company has been chartered here. The object of the corporation is the erecting of the proposed toll bridge across the Potomac at this place. The capital stock is $30,000. Edmund P. Cahill, J. F. Fields, and others are named as directors.

Cheyenne, Neb.—Cheyenne County will vote on a proposition to issue $10,000 in bonds to build a bridge across the Platte.

Lynchburg, Va.—Repairs are to be made to the bridge over Blackwater Creek, at Hollin's Mill, near this city.

Cranford, N. J.—It is suggested that a bridge be erected over the railroad crossing at Union Avenue this place.

Willimantic, Me.—A new iron bridge is to be erected at this place. Address the Town Clerk for particulars.

Philadelphia, Pa.—The following proposals for constructing wrought-iron approaches to Walnut Street bridge, in this city, were opened by Louis Wagner, Director of the Department of Public Works. The figures given are for the following work in detail: 1, east approach, between Piers 1 and 7, inclusive; 2, west approach, between Piers 12 and 41, inclusive; 3, bituminous concrete, 38 feet wide, per lineal foot. Bidders: Levering & Garrigues, Philadelphia, 1, $57,590; 2, $208,874. A. & P Roberts & Co., Philadelphia, 1, $55,263; 2, $208,698. Edge Moor Bridge Works, Edge Moor, Del., 1, $220,989; 2, $58,885; 3, $13.50. Pottsville Bridge Co., Philadelphia, Pa., 1, $61,220; 2, $211,400. Wrought Iron Bridge Co., Canton, O., 1, $62,700; 2, $227,300. King Iron Bridge and Manufacturing Co., Cleveland, O., 1, $72,000; 2, $257,000. Phœnix Bridge Co., Philadelphia, 1, $71,252; 2, $261,012; 3, $13.35. Keystone Bridge Co., Pittsburg, Pa., 1, $71,500; 2, $270,400; 3, $15.

New Haven, Conn.—The Commissioners of New Haven and Fairfield Counties, at a recent meeting, decided to make the new bridge over the Housatonic, at Derby, a 24-foot bridge with two foot-walks 7 feet wide. Contracts will be awarded as soon as possible.

St. George's, S. I.—A survey has been ordered by the Supervisors for a bridge at the Fresh Kill on the County Road, between Northfield and Westfield, S. I.

Oakland, Cal.—Plans are being prepared by Assistant Engineer L. I. Geleonte, for a steel and iron draw bridge across Park Street, at this place.

Long Island City, N. Y.—It is probable that a bridge will be erected over Newtown Creek, at Maspeth, at a cost of $25,000. Address Supervisor Joseph Dykes, Flushing, L. I., for particulars.

Chattanooga, Tenn.—The Chattanooga Railway Bridge and Terminal Company will erect a $500,000 railroad bridge over the Tennessee River, at this city.

Houston, Tex.—The following proposals for the construction of an iron truss bridge, on Sabine Street, to connect the Fourth Ward, north and south, were opened by the Common Council, October 27: George S. Govier, of Dallas, for the King Iron Bridge and Mfg. Co., $9,170. Chicago Bridge and Iron Co., $10,800. Smith Bridge Co., Toledo, O., and approaches, $6 per lineal foot, $6,600. Approaches, per lineal foot, $5. Wrought Iron Bridge Co., Canton, O., $10,190. Groton Bridge and Mfg. Co., Groton, N. Y., Exhibit A, $9,375; Exhibit B, $9,697; Exhibit C, $10,650; Exhibit D, $11,050; Exhibit E, $10,440; Exhibit F, $10,800. Milwaukee Bridge and Iron Works, $9,978. The Berlin Iron Bridge Co., East Berlin, Conn., $12,800. Columbus Bridge Co., Columbus, O., four bids, $9,352.21, $9,014.46, $8,086.80, $8,348.25. Lane Bridge and Construction Co., Newark, O., $10,500, $9,000. Variety Iron Works, Cleveland, O., Plan A, $6,715; Plan B, $6,473. Pittsburg Bridge Co., Pittsburg, Pa., by S. A. D. Oliver, Plan A, $7,458; Plan B, $10,219; Plan A, 5 feet cylinder, $8,125; Plan B, 5 feet cylinder, $9,554. King Iron Bridge and Mfg. Co., Cleveland, O, Plan A, $8,380; Plan B, $8,680. Wisconsin Bridge and Iron Co., Minnesota, Wis., Plan A, $6,076; Plan B, $6,566. Southwestern agent of the Penn Bridge Co., Dallas, Tex., $11,000; sidewalk additional, $500. Trenton Bridge and Iron Co., Trenton, Iowa, $8,050. Lane Bridge and Iron Works, Chicago, Ill., $10,808. The bids were referred to the Board of Public Works, as required by the charter.

Orange Grove, Va.—The sum of $22,000 is to be expended on a bridge to span the Patapsco River at this place.

Elizabeth, Pa.—It has been recommended by the Committee on the Banta Bridge, at Roselle, that the present structure be replaced by a new iron beam bridge, and the Supervisors have adopted the recommendation.

Lincoln, Neb.—A proposition has been submitted to the City Council by the Missouri Pacific, Fremont, Elkhorn and Missouri River roads, to construct two viaducts, at a total cost of $30,000.

Bridges.—See our Proposal Columns for information regarding bridge construction at the following places: Rochville, Mo.; Joliet, Ill.; Zanesville, O.; Willimansette, Mass.; Marble Falls, Tex.

NEW DEPOTS.

St. Louis, Mo.—President Taussig, of the St. Louis Terminal Board, can give information of the proposed construction of a new union depot in this city.

Little Rock, Ark.—The Iron Mountain Railroad will build a $50,000 round-house here.

STREET-WORK AND PAVING.

Newark, O.—The Council has instructed the engineer to prepare plans for a considerable amount of street paving for next season.

Columbus, O.—Considerable street paving is to be done at this place.

Arkansas Pass, Tex.—Street improvements are to be made at this place, at a cost of $15,000.

Houston, Tex.—The City Council has authorized the paving of several streets of this city. The City Engineer can furnish particulars.

Flushing, N. Y.—The sum of $45,000 is to be expended on paving the principal streets of this place.

GAS AND ELECTRICITY.

Rushville, Ill.—The electric lighting plant projected for this place will be constructed at once.

Pittsfield, Mass.—The sum of $25,000 is to be expended on an electric light plant for this place.

Mare Island, Cal. — The Thomson-Houston Electric Company has been awarded the contract for erecting the electric light plant at this place. The plant is to be finished within five months, and is to cost $44,900: it will consist of one 30-light arc dynamo, 2,000 candle-power; 27 arc lamps (double), and all accessories; 2 incandescent dynamos of 1,300 and 650, 16 candle-power light capacity.

Cambridge, O.—Owing to expiration of contract, the Western Electric Company has taken down all arc lamps in this city, they refusing to take less than former price, $72 per lamp. Bids for lighting the city will be asked for at once.

Sturgis, S. D.—An electric light plant is to be established at this place.

Branford, Ont.—An electric light plant is to be established at this place, at a cost of $15,000. Stony Creek and Short Beach, suburbs of this city, are also to be lighted.

Leighton, Pa.—The Carbon County Manufacturing Company has been organized, with a capital stock of $50,000, to start an ice factory and an electric-light plant.

Titusville, Fla.—The electric light plant projected for this place is to be established at once. For particulars address S. F. Gray, as above.

San Francisco, Cal.—The Mutual Gas and Electric Light Company has been incorporated here, with $3,000,000 capital. Directors, Israel W. Knox, Edward Bosqui, and others.

Shamokin, Pa.—It has been decided to establish an electric light plant at this place.

Hannibal, Mo.—The City Council, at a special meeting held October 20, decided to submit to a vote of the people a proposal to issue bonds amounting to $20,000 to increase the power of the electric light plant from 100 to 300 horse-power, to the end that an incandescent light plant may be put in and operated in connection with the present arc light plant owned by the city.

Cramer's Hill, N. J.—The contract for the electric light has been given to the National Electric Light Company of Philadelphia.

Little Falls, N. Y.—It is proposed to establish a system of electric lighting at this place. Address for particulars, Alderman John H. Kane, as above.

Waterford, N. Y.—The question of introducing an electric light plant is being discussed by the local officials.

Electric Railroads.—New electric railroads are projected and improvements are to be made to those already established at the following places: Bethlehem, Pa.; Providence, R. I.; Northfield, Conn.; Gardiner, Mass.; New Bedford, Mass.; Boise City, Idaho; Ottawa, Ont.; Rochester, N. Y.; Austin, Tex.; Middleboro, Mass.; Whitinsville, Mass., Danvers, Mass.; Gloversville, N. Y.; Wilmington, Del.

GOVERNMENT WORK.

Sedalia, Mo.—The following proposals for the erection and completion, except heating, of the post office building at this place were opened October 28, by the Supervising Architect of the Treasury Department: Martin Hendricks, Washington, D. C., $34,837.22; R. K. Allen & Son, St. Joseph, Mo., $35,500; V. Jobst, Peoria, $38,791; W C. Green Brick Co., Wichita, $37,497; W. H. Stemberg, Wichita, $41,979; Anderson Bros., Wichita, $48,900; W. P. Cousley, Sedalia, $49,187; Clark, Raffen & Co., St. Louis, $62,353; L. L. Leach & Sons, Chicago, $45,473; Mode & Stewart, Sedalia, $46,696.

BIDS OPENED.

New York City.—The Board of Trustees of the Hall and Asylum Fund, F. & A. M., have accepted the bid of Dickison & Allen, of Syracuse, N. Y., at $134,500, for the construction of the Masonic Home and School at Utica, upon the park on the confines of that city, now the property of the Fraternity of the State of New York. There were 18 bids received from builders in Massachusetts, Connecticut and this State. The highest bid was $174,000, and the lowest $130,000, but the latter was not considered, for the reason that it was unaccompanied by securities, as called for by the Trustees in their call for bids for the work. The plans for the proposed structure were prepared by architect W. H. Hume, of New York City.

Mendocino, Cal.—Proposals for erecting the State Insane Asylum at this place have been opened, as follows:

Masonry work: Bateman Bros., $115,000; P. R. Wells, $135,055; Richardson & Gale, $110,000; Dennis Jordan, $130,000; A. McElroy, $119,400; A. J. Meany, $112,900; C. Ferris, $104,900, McGowan & Butler, $103,900.

Roofing and galvanized iron work: W. B. Glen, $14,500; W. Cronan, $15,999; Mangran & Otter, $19,237.

Plumbing work: Henry Williamson, $14,450; Joseph Risk, $15,990; J. J. Lawton, $13,321.

Carpenter work: Bateman Bros., $50,800; J. H. McKay, $58,700; Robert McKillican, $68,500; F. M. Mason, $66,000; A. L. Campbell, $53,875; A. McElroy, $59,000; Ingerson & Gore, $59,600.

Contracts were awarded as follows: Masonry work—McGowan & Butler, $103,900; roofing and galvanized iron work—W. B. Glen, $14,500; plumbing work—J. J. Lawton, $13,321; carpenter work—Bateman Bros., $50,800. Total amount of contracts, $182,521.

RAILROADS CANALS ETC.

St. Paul, Minn.—A street car line is proposed from the end of Race Street to Lake Owasso. D. D. Merrill, R. F. Marvin and S. G. Sloan are interested.

INDUSTRIAL.

Wabash, Ind.—The Indiana Steel Company will erect a steel plant here.

Clinton, Ia.—Our correspondent writes: "The City Engineer is preparing plans for a $100,000 plant for the manufacture of street paving and building brick."

Lowell, Mass.—The Shaw Stocking Company will double the capacity of their works.

Madison, Ill.—Railroad car works, to cost about half a million dollars, will be erected here. The Merchants' Terminal Bridge Railway Company, of St. Louis, Mo., are interested in the enterprise.

Seattle, Wash. — The Commission of United States engineers appointed to have charge of the survey for a ship canal to connect Lakes Union, Washington and Samomosh, consisting of Col. G. H. Mendell, Major T. H. Handbury and Capt. T. W. Symons, have held a meeting and placed the matter in the hands of Captain Symons, who has employed Philip G. Eastwick to superintend the work.

Pell City, Ala.—A company, with a paid up capital of $200,000, has been formed for the purpose of erecting a plant at this place for the manufacture of all kinds of iron pipe and plumbing fixtures. Operations are expected to begin within 90 days.

SPECIAL OFFERS.

DOUBTLESS many of our subscribers have a friend or friends who think of subscribing to THE ENGINEERING AND BUILDING RECORD for the coming year, and as every paper, however successful it may be, desires to increase the number of its subscribers, the following offers are made, to hold good during October, November and December, 1890:

Any present subscriber can have his subscription extended one year by sending:

One Renewal and One New Subscription	$7.25
" " " Two " "	10.00
" " " Three " "	13.00
" " " Four " "	16.00

The new subscribers will receive, free of charge, the remaining issues of 1890, that is, those which appear after the order is received.

THE ENGINEERING AND BUILDING RECORD,
P. O. Box 3037. 277 Pearl Street, New York.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS' NOMINATIONS FOR 1891.

THE nominations for officers of the American Society of Civil Engineers for the coming year, as reported in another column, will excite special interest, because of the nomination for secretary.

This is the first time that the members are given the opportunity of voting in the regular way in favor of the policy that the chief executive officer of the society—*i. e.*, the secretary, should be a man who is not practicing the profession of a civil engineer, but who gives his entire time and efforts to the society and to the furtherance of its interests. Our readers will remember that this journal distinctly advocated such a policy several years ago, when the present popular secretary was elected to the office of State Engineer. His growing practice as a consulting engineer, and his duties for the State, have made it manifest that it is a physical impossibility for him to give to the society the time that its members have a right to expect and that its interests demand. We presume that the nomination of another man for the position of secretary is due to the fact that Mr. Bogart is unwilling to give up the active practice of a profession, in which he has attained distinction, for the salary which the Society will pay its secretary. His election to the position of first vice-president will, however, be an honor well-earned by long and valuable services.

The nominating committee are deserving of credit for giving the membership of the Society the opportunity of declaring for or against the policy that the chief executive officer should not be in active practice, but should devote his sole time and energies to the Society's interests. It should be distinctly understood that in adopting this policy it is no reflection on the present secretary, because he accepted, and has held, the position with the distinct understanding that he was to remain in active practice.

WISDOM IN NOT SELLING A WATER-WORKS FRANCHISE TO THE HIGHEST BIDDER.

THE authorities of Montclair, N. J., an attractive suburb of New York, have recently taken an action with regard to the purchase of their water-works, under an option held by them, from the original builders of the same, which is noteworthy as one of the few instances where public officers have the courage to decide a case on its merits, in spite of the criticism that follows a refusal to let a contract to the lowest bidder, or to sell a franchise to the highest one.

The water works at Montclair were owned by responsible parties, who are also connected with the corporation which own water privileges in the Ramapo Water Shed, and who are now constructing works to carry out their contract to furnish Newark with a new supply. It is only a question of time when the Montclair Company will have to abandon its present source of supply as being in danger of contamination, because of the growth of the town. When that time arrives, the present owners would be in possession of the most available source—and if other parties owned the works they would, in all probability, have to purchase water of them on their terms, or maintain an inferior service. The town cannot, at this time, issue bonds to buy the works, yet they might have taken the option, under a sharp construction of their contract, in order to sell it again to speculators at a profit. The decision, therefore, not to make merchandise of the option was, under the circumstances, a wise one, since the character and responsibility of the owners of a water-works franchise is a most important consideration.

We commend such action to the authorities of other communities who fear criticism on the rejection of the lowest bid, though their judgment tells them such action would be for the ultimate best interests of their town.

THE PROPOSED JUNGFRAU RAILROAD AND ITS PROBABLE EFFECT ON THE HEALTH OF THE PASSENGERS.

AS NOTED in our columns a short time ago, the Swiss Federal Council has under consideration proposals for constructing a railroad up the Jungfrau Alp for the convenience of tourists. The question as to whether the great and rapid ascent to be obtained would be injurious to the health of the passengers has been referred to a medical committee, consisting of Geelick, Kronecker and Veith, whose report, dated September 18, is now before us.

The proposed railroad would be about 6 kilometers long, and rise from an altitude of 870 to one of 4,130 meters above sea level. One of the plans proposes to use a cable, another compressed air as the motive power. The greater part of the road would lie above the level of the perpetual snow line, and the dangers to health would arise in part from exposure to cold and storms, but chiefly from the comparatively sudden diminution of atmospheric pressure. So far as the question of exposure is concerned, the projectors propose to avoid it by constructing the road largely, or entirely, in tunnels. On the pneumatic plan the tunnel would be a necessity.

Many men on the Andes and the Himalayas live continuously at heights of from 3,000 to 4,000 meters above the sea level, and in Thibet there is at least one village, at the height of 4,900 meters, where the inhabitants do not appear to be injured by their elevated positions. Nevertheless, it requires a long period to fit men to live under such unusual conditions, and the more sudden the change the greater the suffering.

In the construction of a tunnel in the Andes for a road from Callao to Oroya, the tunnel being at an altitude of about 4,000 meters above the sea, almost every workman, except those who were natives of the vicinity, suffered from the rarity and diminished pressure of the air. Sensations of want of breath, palpitation of the heart, giddiness, headache, etc., are common. In some cases, where the ascent has been rapid, there are hemorrhages, and these are especially to be feared in cases of advanced disease of the lungs. Usually, travelers ascending mountains begin to complain at an elevation of about 3,000 meters, but there are great differences in different localities in this respect.

The report suggests that any peculiarities of this kind which the vicinity of the Jungfrau may have can easily be determined by experiment, using a captive balloon for the purpose, and finishes with the conclusions: (1) That the construction of such a railroad is possible; (2) That it should not extend above a height of 3,000 meters; (3) That it is not expedient to grant a permit for the construction of the road until those who seek the privilege have shown that such a rapid ascent is without danger to health. The latter clause would have no weight in this country. We should say that if the promoters of the road chose to take the risks of its being a pecuniary failure, as it certainly would be if a few cases of serious injury to health occurred among its passengers, they could do so, and should leave it to their self-interest to furnish the demonstration suggested.

THE PANAMA CANAL.

The Panama Canal Company will be given an opportunity to pass its work over to a new company, under the provisions of the bill in reference to its affairs, which it is expected will soon become a law. In the bill the Colombian Government grants the representative of the company an extension of ten years in which to complete the canal and open it to traffic. The extension is granted on numerous conditions. The bill provides that a new company shall be formed to finish the work, to which company the liquidators of the present company shall turn over the canal, its equipments, etc. The new company is to be organized with sufficient capital to complete the work, and to recommence excavations within eighteen months from the date of the signing of the contract under the present law.

The present company is to cancel, as indemnity to the Government, for expenditures incurred on the Isthmus, the $500,000 loan for which the Government is now liable. The company will be obliged to furnish the Government $100,000 per year in order to maintain a garrison of 250 men to preserve order along the line of the canal while work is in progress, and subsequently for the protection of the transit. The lands required by the company for all artificial lakes and banks will be gratuitously ceded when the Government is the owner, and, when private individuals, they will be judicially expropriated and transferred to the company at a cost not calculated in their possible value subsequent to the completion of the canal.

In return for the extension of time the company will be required to pay the Government $4,000,000, and to cede shares and privileges in the new company to the value of $4,000,000. The payment of this sum is to be made within five years, in yearly installments, the first installment to be paid in three months after the new company shall have been definitely formed. Should the new company not be organized and work resumed within the eighteen months fixed, the contract in force will become void and the Government will take possession of the property. The delegate the Government had the right to appoint on the managing council of the old company will hold the same advantages in the new company. The guarantee of $150,000 given by the company will continue in force in order to insure compliance with the obligations imposed by the former contract and those that may be made. The Government is authorized, in case the privileges expire, as provided by the old contract, or under the conditions of the bill, to contract with a new company for the completion of the canal under certain conditions.

NOTES.

Ottawa, Can., is to have an electric street car line, and a local firm has been awarded the contract.

According to *L'Electricite*, Santa Cruz, a city of 16,000 inhabitants, and the capital of the Canary Islands, has a soil of such extreme hardness that trenches and street excavation for gas works have been impracticable, and present negotiations for an electric light service make special allowance for the post holes, and reduce their number as much as possible.

According to a Corpus Christi, Tex., account, a party of Government engineers recently viewed Rope's Pass through Mustang Island, from Corpus Christi to the Gulf. The passage now is a canal 30 feet wide by 16 feet depth, with a fall of about 6 inches to the mile, two miles long, through Mustang Island. The project is to dig a ditch 30 feet wide and 16 feet deep from Corpus Christi to the Gulf. This, it is thought, will in 90 days make a channel 500 feet in width, of sufficient depth to admit the passage of vessels of the largest draught.

The Allegheny, Pa., County Road Convention met at Pittsburg last week. The object of the convention was to take action in regard to the enactment of a law by the next Legislature for the improvement of the public roads.

The prevalence of diphtheria at San Francisco, Cal., is ascribed to the neglect to flush the city's sewers.

Spokane Falls, Wash., utilizes water power for generating electricity, the latter serving for both lighting and power purposes. There is an available head of 70 feet of water and 12 pairs of Victor turbines are employed.

Springfield, Mass., is studying the electric street car problem with the view of adopting one of the several systems now available.

The project to construct a ship canal across New Jersey, from the Delaware to the Atlantic, has already taken hold of the public mind, and seems to rank high among the probabilities of the future.

IMPORTANT TUNNELS OF THE WORLD.

Among the important tunnels of the world, the following have recently been given :

The Allegheny Portage tunnel was built in 1831.

The Black Rock tunnel, on the Reading railroad, was constructed in 1836.

A tunnel 6 606 feet long was driven under Lake Erie from Cleveland, O., for the purpose of obtaining pure water.

The Sand Patch tunnel, on the Pittsburg and Cornellsville branch of the Reading, was completed in 1871.

Cæsar found Alexandria honeycombed with subterranean tunnels supplying water from the Nile to the houses of the city.

The St. Gothard tunnel through the Alps was begun in the fall of 1872. Its length is nine and a quarter miles and its cost some $10,000,000.

The Kingwood and Broadtree tunnels, and the Chesapeake and Ohio railroad and the Great Bend tunnels are specimen pieces of heavy tunneling in the United States.

The Hudson river tunnel is progressing satisfactorily. The daily progress is 3.4 feet. The distance already reached is 2,260 feet, the total distance to be covered being 5.060 feet.

The tunnel driven under Lake Michigan, to secure pure water for Chicago, begun in March, 1864, was constructed two miles in length to a crib in the lake, inside of which an iron cylinder was sunk.

The new aqueduct from the croton dam to New York City, a distance of 29.63 miles, or including the pipe lines to the Central Park reservoir of thirty-three miles, is the largest piece of tunneling yet done.

Of subaqueous tunnels the most famous is that under the Thames at London, begun in 1807 and finally completed for foot passengers in 1843; total length, 1,200 feet; cost, $6,000 a lineal yard, or a total of $2,500,000.

The cast-iron tunnel under the St. Clair river, connecting Canada with the United States, has recently been completed. The total length is 6,050 feet, of which 2,300 feet is under the river bed. The outside diameter is 21 feet.

The Mont Cenis tunnel was a tremendous engineering work, in which air pumps were worked by hydraulic power although the work was begun by hand labor in 1857. It was finished in 1871, the total cost having been $15,000,000.

The Hoosac tunnel project was originally considered as far back as 1825. It was not until the Shanly Brothers, of Montreal, in 1868, took the contract that construction was rapidly pushed. They completed their work in December, 1874.

The Roman tunnels served as aqueducts, the one to tap Lake Albanno, begun 389, B. C., being 6,000 feet long. On the aqueduct to connect Lake Fucinus with the River Liris 30,000 men were employed for ten years, the work being finished A. D. 52.

The Musconetcong tunnel, on the Lehigh Valley railroad, a specimen of heavy tunneling by means of machine drilling, was begun in 1872 and finished in 1875.

If "Architect" of Brooklyn, N. Y. will send us his name and address, his letter under date of November 4 will receive attention. Ordinarily anonymous communications are destroyed unnoticed.

MEETINGS OF ENGINEERING SOCIETIES.

The American Society of Civil Engineers holds its regular meetings on the first and third Wednesday in each month, at the House of the Society, 127 East Twenty-third Street, New York.

The Boston Society of Civil Engineers holds its regular meetings at the American House, Boston, at 7.30 P. M., on the third Wednesday in each month.

The Western Society of Engineers holds its regular meetings at No. 78 La Salle Street, Chicago. at 7.30 P. M., on the first Wednesday in each month.

The Engineers' Club of St. Louis holds regular meetings in the club's room, Laclede Building, corner Fourth and Olive Streets, St. Louis, on the first and third Wednesdays in each month.

The Engineers' Club of Philadelphia holds regular meetings at the House of the Club, 1122 Girard Street, Philadelphia.

The Engineers' Society of Western Pennsylvania holds regular meetings on the third Tuesday in each month, at 7.30 P. M., at its rooms in the Penn Building, Pittsburg, Pa.

The Engineers' Club of Cincinnati holds its regular meetings at 8 P. M. on the third Thursday of each month at the Club rooms, No. 24 West Fourth Street, Cincinnati.

The Civil Engineers' Club of Cleveland holds regular meetings on the second Tuesday of each month, at 8 P. M., in the Case Library Building, Cleveland. Semi-monthly meetings are held on the fourth Tuesday of the month.

The Engineers' Club of Kansas City meets in Room 200, Baird Building, Kansas City, Mo., on the second Monday in each month.

The Engineering Association of the Southwest holds regular meetings on the second Thursday evening of each month at 8 o'clock, at the Association headquarters, Nos. 63 and 64 Baxter Court, Nashville, Tenn.

The Civil Engineers' Society of St. Paul meets at St. Paul, Minn., on the first Monday in each month.

The Montana Society of Civil Engineers meets at Helena Mont., at 7.30 P. M., on the third Saturday in each month.

The Civil Engineers' Association of Kansas holds regular meetings on the first Wednesday in each month at Wichita, Kan.

The New England Water Works Association holds quarterly meetings in Boston at Young's Hotel.

The Canadian Society of Civil Engineers holds its regular meetings on each alternate Thursday, commencing with the 9th of October, at the House of the Society, 112 Mansfield Street, Montreal.

The Engineering Department of the Brooklyn Institute, Brooklyn, holds regular meetings, at 8 P. M., on the third Tuesday of each month. Until the Institute building is repaired, the meetings will be held in the rooms of the Young Men's Christian Association Building, 502 Fulton Street.

PERSONAL.

J. H. Robinson has been appointed as Building Inspector for Duluth, Minn.

Dunham & Paine, civil engineers, have moved their offices from Cleveland, O., to 150 Broadway, New York City.

W. P. Rounds, C. E., has been appointed Superintendent of the La Salle, Ill., Water-Works, and not Secretary, as recently stated.

Edward Tamsen, mechanical engineer, of Brooklyn, has accepted the position of Superintendent of the works of the Niagara Water Meter Company of that city.

The new Board of City Affairs, of Cincinnati, O., appointed by the Mayor, consists of Thomas G. Smith and Dr. Graydon, of the former Board, Gustav Tafel and Fechheimer. D. W. Brown, of the old Board, was elected clerk.

Max Reber, C. E., one of the staff of engineers of the Nicaragua Canal Construction Company, is visiting his home at St. Louis, Mo., after an absence of 18 months in Nicaragua. He will return to his post of duty in a few days, to be absent two years.

OBITUARY.

William J. Simmons, President of Eckstein Norton Industrial College for Colored Youths, died near Louisville, Ky., on October 30. Dr. Simmons was for ten years President of the Colored State University at Louisville.

Drury Underwood, contractor, and President of the Missouri and Kansas Interstate Fair and Exposition Driving Park Associations, was killed on October 28, at Kansas City, Mo., on the Chicago and Alton Railroad crossing.

Mr. William Washburn, architect, died in Boston on October 31, aged 82. He made a specialty of hotels, and the Fifth Avenue and Victoria Hotels of New York, the Adams House, Parkers', Tremont, American, Revere House, Young's Hotel, and Tremont Temple, Boston, and the City Hall, Charlestown, are examples of his work.

ENGINEERING SOCIETIES.

THE 273d meeting of the Western Society of Engineers was held at Chicago, on October 1, 1890. President L. E. Cooley in the chair, and some 60 members and visitors present.

The following members were elected:

Charles E. Hopkins, Charles V. Weston, Theodore Starrett, Jacob A. Harman, Henry E. Gamble, Ira Smith Dunning, L. C. B. Holmboe, Charles J. Morse, William E. Miller, Ridley H. Lawence, Harold A. Boedker.

In reply to a call from the President for reports of standing and special committees, Mr. Isham Randolph for the Committee on the Chicago Railway Problem, etc., stated that offices had been rented and that funds for the preliminary work had been received.

Mr. O. Chanute for the Committee on Bridge Legislation stated that the committee had had some meetings. It has entered upon the gathering of data, and has succeeded fairly well in getting some of them. The committee has undertaken to ascertain, first, what legislation concerning bridges has been had in foreign countries, and it has obtained the legislation in Great Britain, France, Austria and Germany, of which it will give an abstract in its report. It has also obtained the data concerning legislation heretofore proposed in the United States, and has also obtained data concerning the practice of the leading railroads in the United States, more especially in regard to bridge floors, which is considered the one important thing for legislation to touch upon. It will take some months for the committee to gather all the data it wants to present to the society, and it hopes that when it finally hands in its report it will have gathered all the information necessary to arrive at a correct opinion of the subject, and to judge as to what legislation is best, and what is possible to accomplish.

Mr. Isham Randolph then read an interesting paper on "Railroad Signaling and Interlocking."

A large part of the evening was devoted to a discussion of the subject of railroad safety appliances.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS held a regular meeting on November 5, President W. P. Shinn in the chair. After the transaction of routine business, an informal statement was made of the report to the Board of Direction by the Nominating Committee, who presented the following nominations:

President, Octave Chanute, Chicago, Ill.; Vice-Presidents, John Bogart, New York, and Charles Hermany, Louisville, Ky.; Secretary, John C. Trautwine, Jr., Philadelphia, Pa.; Treasurer, George S. Greene, Jr., New York; Directors, Theodore Cooper, New York; Rudolph Hering, New York; E. P. North, New York; Clemens Herschel, New York, and S. Whinnery, Cincinnati, O.

The paper of the evening was on "Self Purification of Water in Flowing streams—A Biological Consideration," by Charles G. Currier, M. D The paper was illustrated by stereopticon and microscopic exhibits, and exhibits of specimens under culture, of various kinds of bacteria. Dr. Currier described the mode of culture and study of bacteria, and extensive tests and experiments he had conducted to determine their presence in river, lake and spring water throughout this continent and in Europe, and concluded that, when not subject to continued pollution throughout its course, a running stream tends to reduce the number of bacteria as it flows away from their source. Both dilution and sedimentation, and, in a slight degree, impact and oxidation, appeared to diminish the numbers of bacteria, and some chemical treatments were notably efficacious; but he recommended, primarily, the careful protection from pollution of water sheds and the sprinkling of dusty roads near exposed reservoirs.

The paper was discussed by C. B. Brush, W. E. Worthen, R. L. Harris, F. S. Washburn and others, and Dr. Currier was requested to return and resume the discussion at a subsequent meeting. Adjournment was followed by the usual collation.

The following candidates were declared elected:

As Members.—Francis Renatus Fava, Jr., Professor of Civil Engineering, Corcoran Scientific School, Columbian University, Washington, D. C.; Alexander Edward Kastl, First Assistant Engineer improvement mouth of Panuco River, Tampico, Mexico; John Nelson Ostrom, Bridge Engineer, New York City; James Ritchie, Civil Engineer Pittsburg Testing Laboratory, Pittsburg, Pa.

As Associate.—Henry Sylvestre Jacoby, Assistant Professor Civil Engineering, Cornell University, Ithaca, N. Y.

As Juniors.—Henry Lewis Davis, employed in City Engineer's department, New Haven, Conn.; Walter Lawton Dusenberry, Assistant Engineer to Engineer of Construction, Department of Public Parks, New York City; George Hebard Paine, with Union Switch and Signal Company, Swissvale, Pa.; Lee Treadwell, Engineer in Charge Pacific Short Line Bridge Company, Sioux City, Iowa; Arthur Lee Shreve, Assistant Engineer, City Engineer Department, Baltimore, Md.

INTERNATIONAL CONGRESS OF HYGIENE.

A CIRCULAR just issued by John S. Billings, M. D., directs attention to the fact that the Seventh International Congress of Hygiene and Demography will be held in London during the week beginning August 10, 1891.

The governments of all countries and municipalities, and all public health authorities, universities, colleges and societies occupied in the study of the sciences more or less immediately connected with hygiene, are invited to cooperate and appoint delegates to represent them at the congress. The Prince of Wales will preside.

A Committee of Organization has been formed, of which Sir Douglas Galton is Chairman and Prof. W. H. Corfield and Mr. Shirley F. Murphy are Honorary Secretaries. An exhibition of articles of hygienic interest will be held in connection with the congress. The last of these congresses was held in Vienna in 1887, and was attended by over 2,000 persons, and it is expected that the London meeting will be one of great magnitude and importance.

THE HENNEPIN CANAL.

THE Secretary of War has approved the report and recommendations of Captain W. L. Marshall, of Chicago, Engineer in Charge of the Illinois and Mississippi Canal. The River and Harbor Bill approved September 1, 1888, provides that the route of the canal shall commence at a point near Hennepin, the same to be located by the Secretary of War. The report recommends that the work begin near the mouth of Rock River. A large portion of the $5,000,000 appropriated by Congress for the work will be expended near this point in locating locks, dams, surveys, etc. A portion of it, the Secretary decides, will also be expended at Dixon, Ill.

HISTORY OF CINCINNATI'S WATER-WORKS.

PROBABLY no other department of the city of Cincinnati possesses a more interesting history than that of the Water-Works. The Cincinnati *Times-Star*, in a recent issue, refers to it as follows:

"The very earliest notice given of an attempt to supply the citizens with river water is that of 1802, when James McMahan fastened a cask to the middle of two long poles, and then hitched an ox in between (using the poles as shafts) and dragged water around the city. In 1806 William Gibson rigged up a cask on wheels, and with his water-cart hauled and distributed water for a living.

"In 1817 Jesse Reeder built a wood reservoir on the banks of the Ohio, near Ludlow Street. He filled it from a well which was dug at the south end of the reservoir. This well was connected with the river by an open ditch, and was dug down below low-water mark, so that it was always full. The well was curbed with wood and had a wooden roller at the top and bottom. Two tubes extended to the bottom of this well, and through the tubes ran an endless chain, which carried small leather buckets 20 inches apart. The chain was set in motion by the turning of the upper roller, and every time a bucket came up it emptied its contents into the wooden reservoir. This machine was nothing more or less than a chain pump propelled by a sweep wheel, with a blind horse attachment, the latter walking in a circle.

"The next pumping arrangement was on the site of the present Front Street works, and consisted of two divisions, one by the river and the other across the road, now called Front Street. The south works contained the lifting pumps, which raised the water from the river and forced it through wooden pipes into a tank in the north side works. From this tank the second pump delivered the water into the reservoir above it. Every part of the machinery was of wood. The pumps were run by horses or oxen, working on an ordinary tread-mill.

"This system was a great improvement on the water carts, but in 1824 Mr. Davies, the leading man in the Water-Works Company, was compelled to apply new power to his pumps. This new demand was on account of the increased consumption of water, and also on account of the leakage in the wooden pipes. Mr. Davies was so successful in his last venture that the new pumps only had to work three days in the week at first. The improvement that worked in this startling manner was a set of new pumps run by steam. The boiler and engine of a broken-down steamboat were bought by Mr. Davies and arranged for a pumping engine. This engine had one steam cylinder, with slide valve. The beam and fly-wheel were of wood, as were the two lifting pumps. Two iron force pumps operated on a level with the engine and forced the water up the hill into the reservoir. The whole arrangement was confined to one spot, the site of the present pumping house. The two lifting pumps were attached to the heavy wooden beam above by means of a long wooden lever. They had a 6-inch cylinder. The two force pumps were of 7-inch cylinder, and all the levers had a 4-foot stroke. This pump was used up to 1844. It was of 40 horse-power, and had a capacity of 1,200,000 gallons in 24 hours. The plant was valued at $40,000. It was remodeled and improved by Anthony Harkness in 1828, but its power would not admit of much forcing, consequently Mr. Harkness, in 1832, constructed a helpmate for the 'Vesta,' which he named 'Old Betsy.' This engine had a capacity of 3,000,000 gallons in 24 hours.

"The large expenditure for fuel for these two engines led to an inquiry as to how expenses might be curtailed. An engineer named Buford submitted a report in which he advocated the utilization of the water power from the Miami Canal as a substitute for the steam-pumping system. Council, however, failed to recognize the merits of the new system, and it was dropped.

"In 1844 the old steamboat engine, 'Vesta,' was abandoned, and all work was done by 'Old Betsy' A new engine was put up in 1846, at a cost of $75,000, by Messrs Yeatman & Shields. It failed to give satisfaction, and at one time proceedings were about to be instituted against the contractors. In 1851, another engine was put up. It was built by Harkness & Son for $30,000. In 1854, a duplicate of the above engine was constructed by Powell & Son for $35,000. The same year, 'Old Betsy,' after a service of 22 years, was abandoned. In February, 1861, work was commenced on the now famous big Shields engine. It took four years to complete it, and cost, up to January 1, 1867, $360,000. Its maximum capacity is 20,000,000 gallons. The total weight of castings for engine and pump was about 900 tons.

"September 1, 1869, auxiliary works were established to supply the hilltops. The pumps were located on Hunt Street and the water was delivered to the tanks on Mt. Auburn. At present Hunt Street has three double engines, two Worthingtons, two Warden and two Niles. Up to 1880 they have cost the city $184,475.

"In February, 1879, a western supply house was started at Price Hill. It has three engines, two Walden & Maxwell and one Worthington. They were started pumping in November, 1881. Only one engine is used at a time, at present, and ample provisions have been made for increased demand.

"In 1872 to 1874 two large Scowden pumps were put into the Front Street house. They cost $198,000 and have a capacity of $7,500,000 gallons each. The Wetherill pumps were added to the force, at the same place, about five years ago. In July, 1888, two new Worthingtons were put in in place of the old Shields engine that had been in use since March, 1847. The water-works have in operation also, besides the regular pumps, six new ones at the Front Street house. They are known as the auxiliaries and were put in this spring. In all there are 24 pumps either in constant use, or ready for use in case of need.

"The report of the first water-works, the elevated wooden reservoir erected by Jesse Reeder in 1820, in this city, was that the system of supplying the public from reservoirs was a failure, because of the proprietor's failure to get the patronage of the public, they urging that the water was exposed to the sun, and hence there were grave doubts as to its purity. This 'dead water' was discarded and people preferred to drive to the river and scoop up their own 'live water.' This failure ended the water-works of Jesse Reeder. However, this was only a private concern. On March 31, 1817, a charter was granted to the 'Cincinnati Manufacturing Company,' as follows: 'Section 1. Be it ordained by the Town Council of the town of Cincinnati, that the Cincinnati Manufacturing Company, their heirs, successors and assigns, shall be, and they are hereby vested with the exclusive privilege of conveying water, by tubes or otherwise, from the Ohio River through the streets, lanes and alleys and commons of the town of Cincinnati, for the purpose of supplying the inhabitants of said town therewith; which privilege may and shall be enjoyed by the said company, their heirs, successors and assigns exclusively as aforesaid for the term of 99 years from and after the passing of this ordinance.'

"For this ordinance the sum of $100 was to be paid to the city annually. The company, however, made a failure of their venture and asked for an extension of their charter to July, 1820. It was granted, and they issued the following advertisement looking to the securing of the wooden pipes through which the water was to be conducted: 'The subscribers will contract for the delivery at their water works of 1,000 logs of sound timber, either white pine or white oak.' This extensive contract broke the company up completely, and they transferred their rights to Samuel W. Davies, who pushed the first public water-works to a successful issue. Mr. Davies, however, failed to fulfill his contract, namely, the annual $100, and the people also became dissatisfied with his work. The following report explains itself: 'The committee appointed to examine the reservoir of the water-works, from which this city is supplied with water by Col. S. W. Davies, have performed that duty, and after a strict examination, report the reservoir to be in excellent order, the water being clear and pure, and in a wholesome state.' In October, 1823, a committee of Council formally complained of three things: 'First, the payment of money was in arrears; second, the proper number of penstocks had not been erected; third, the water was kept off during the night.' The report adds: 'This last violation has a tendency to seduce the citizens into a fatal security, while the devouring element spreads its devastating hand.' To prevent the wanton waste of water Council passed an ordinance January 7, 1824, which fined offenders $10 and costs for such offenses. Endeavoring to meet increasing expenditures vainly, Mr. Davies became financially embarrassed and offered to sell out to the city for $30,000. A committee reported favorably concerning the purchase and gave ample reasons for their opinion, in these words:

"'We believe that the city ought to own the waterworks. It is a work of so public a character that its management should be directed more to public interest than to individual emoluments We find that the reservoir is permanent and will contain upwards of 200.000 gallons of water, and may be enlarged at an expense of about $250 so as to contain 50,000 gallons more. Allowing 100 gallons per day to each family it will then supply 500 families. The pipes are of wood connected by iron and may be relied upon for fifteen to twenty years. We hesitate not to say that the whole work is executed in a manner creditable to the persons employed in it, and that it is an establishment of great value to the city. The expenses of raising the water at present is as follows, supposing the engine to run every day excepting Sundays: 30 bushels of coal at 8 cents, $2.40; two hands at $1.50, $3. Total, $5.40 per day, or $1,698.20 yearly. The present subscription from 254 subscribers is $2.832. There are on the line of the pipe 651 houses. Part of the power of the engine is now rented for a nail machine at $1 per day. The property has cost upwards of $40.000 and the owner has involved himself in debt to pay for it. We do not think that the city can suffer such an establishment to decay.'

"The question of purchase caused considerable excitement and was defeated by a vote of 294 to 25. The editor of the *Gazette* cautioned discretion, and said: 'If the city desired to purchase the works, the annual expenses of keeping them in repair should be ascertained, in order to know of the ability of the city to support such heavy expenditures without inconvenience.' The Cincinnati Water Company then bought the works in 1826, but it was no better, the reports duly complaining that the same rule existed of shutting off the water at night to prevent wastage, and that at times it stopped for days to be repaired. In December, 1831, the city was out of water for three weeks, owing to a fire which destroyed the pumps and part of the buildings. In February, 1832, Council decided to offer $150,000 for the works if the citizens should sanction the purchase. The citizens again voted against it, two to one. In 1846 the question of purchase was once more revived.

"Again nothing further was done. Then the water company advanced rates 20 per cent., and in the storm of public indignation which followed a vote was taken. It was a very decided one, and stood 1.573 for and 311 against. To appease the public clamor for cheaper water, Council went so far as to consider the advisability of abandoning the 'immense engine' for the water-power from the Miami Canal. Immediate steps were taken to consummate the sale, and it was ratified by Council June 17, 1839, the amount being $300,000 in city bonds. The first Board of Directors was composed of Edward Woodruff, E. Hinman, Q. Lovel, A. H. Ewing, W. S. Hubbelli Z. Martin. The following is the first annual report: 'Amount of water rent collected, $60,280.11; extension and improvement of works, $13,268.16; returned water rents, $1,839.77; current expenses, $15,344.44; amounts paid on bonds, building material, etc., $60,280.11; balance, being amount of receipts over expenses, $29,270.78.'"

THE completion of the St. Clair Tunnel has revived the project of a tunnel across the Straits of Northumberland to Prince Edward Island.

THE NILE'S TWO BIG DAMS.

IN the month of June last, what the London *Times* calls "the greatest engineering achievement which English enterprise and skill have as yet attempted on the banks of the Nile," was quietly brought to a termination. Sir Colin Scott Moncrieff, the Under Secretary of State for Public Works, has recently drawn up an account of the works that have been in progress since 1886 to put the Nile barrage into a thoroughly sound condition, and the following short account in the *Times* of what he states may not be without interest:

"The Nile barrage consists, as most people are aware, of two great dams or weirs placed across the river at the point where it divides into two branches, one flowing out into the sea at Rosetta and the other at Damietta. Each weir is a long bridge, the arches of which can be closed when required, so as to hold the water up, and at the sides are locks for the passage of boats. During low Nile the arches are closed, and the water above the barrage is raised and diverted into three main canals, which irrigate the whole of Lower Egypt. When the river is in flood the arches are opened, and every possible obstruction to the flow of the stream is removed.

"The barrage was begun in the year 1843, under the direction of Mougel Bey, a French engineer, and it was finished in 1861. The Rosetta barrage consisted of 61 arches, and its total length was 465 meters; the Damietta barrage, with a length of 535 meters, was constructed with 71 arches. The total cost of the work amounted to £1,800,000, a sum which does not take into account the enormous quantity of forced labor which was employed on its construction. The Rosetta barrage was fitted with gates, and was tried for the first time in 1863. Cracks soon appeared, and a serious subsidence occurred in 1867, after which date any attempt to make use of it was abandoned. During this period the maximum height of water held up was 5 feet 9 inches, and that was only for a short time. On the Damietta side the arches were never supplied with gates at all.

"On Sir Colin Scott Moncrieff's arrival in Egypt in 1883, one of the first schemes that came before him was a proposal to irrigate the whole of Lower Egypt by means of pumps, at an initial cost of £700,000 and an annual outlay of £250,000. Disregarding the opinions of experts, who all warned him that the barrage was a worthless failure, Sir Colin wisely decided that, before having recourse to extravagant expedients for irrigating the country, it was at least worth while to give the barrage a trial, and see whether something could not be made of it. It required a very high degree of moral courage to incur so heavy a responsibility. as the consequences of failure would have been extremely disastrous. The barrage, which even when new had not been considered strong enough to do the work required of it, had been absolutely neglected for 15 years. The timbers were rotten and the iron rusted. There were no officials competent to superintend its working. During the two following years, 1884 and 1885, the most unsound portions of the barrage were patched up at a cost of about £44,000, and during the season of low Nile an attempt was made to hold up the water by means of it. In the first year the level was raised by 7 feet 2 inches, and in the second year by 9 feet 10 inches. This enabled the canals to be flushed, and caused a very considerable increase of irrigation in Lower Egypt.

"It was, however, impossible to continue for an indefinite period a system which was only made to succeed by the incessant watchfulness of the superintending engineers. At any moment an accident might have stopped irrigation at the most critical season of the year, and the whole cotton crop, upon which the prosperity of Egypt is so largely dependent, might have been almost entirely destroyed. When, therefore, the great powers in 1885 gave their consent to a million being spent upon irrigation works, the first work undertaken was the putting of the barrage in a thoroughly sound state.

"The ground upon which the foundations of the barrage are laid consists of nothing more solid than alternate beds of fine river sand and alluvial mud. During low Nile, when the arches are closed, there is a difference of level in the water on either side, amounting in June, 1885, to nearly ten feet. Hence the water has a constant tendency to percolate under the foundations and establish a uniform level. In doing this it carries along with it particles of the mud and sand on which the barrage rests, and by degrees undermines the whole structure. The problem was, then, to build across the river a foundation either sufficiently deep or sufficiently broad to stop the water from passing underneath, or to compel what little did pass to travel so far either vertically or horizontally that its velocity would be checked. In this way not only would the water be unable to wash away the sand and mud, but it would even deposit the particles of sand and mud which it brought along with it, and thus the substratum would every year become more and more impermeable.

"After careful consideration it was decided to spread the foundations out horizontally, so as to form a broad water-tight platform, rather than to sink a deep wall of

LIVERPOOL PAVEMENTS.

CONSUL SHERMAN, located at Liverpool, England, in a report on the pavements, sewers etc., of that city, says that the Corporation of Liverpool has adopted the policy of constructing its public works in the best possible manner, and in this way has succeeded in reducing the cost of maintenance to a minimun. Since 1872 only impervious pavements have been laid, and Liverpool has now 250 miles of the best paved streets in the world. The wisdom of this is not only seen in the reduced death rate, which has declined from 27.2 per thousand in 1880 to 20.3 in 1888, but in the reduced cost of maintenance of the streets. In 1879 the estimated expenditure of the cost of keeping 226 miles of streets in repair was $136,080; in 1889 the estimated expense for the same was only $40 824 for 250 miles of pavement. Permission, he says, is never given for private parties to cut through the pavement of any street for any purpose. When such work is neccessary, the corporation will do it in its own thorough way, and the interested parties must pay the entire cost. All the street railway tracks are laid and owned and kept in repair by the city, and the company using them pays an annual rental of 10 per cent on their cost.

concrete in the river bed. The latter would have cost much more, and, moreover, it was feared that the result of making deep excavations close to the barrage might bring the whole structure down. Besides adding to the width of the foundations, it was necessary to give additional solidity to the whole work. For this purpose a solid bed of Portland cement concrete, four feet thick, was spread over the old flooring, and covered under the arches and down stream where the action was severest with a heavy pavement of dressed Trieste stone, and up stream with rubble limestone masonry. A line of sheet piling, 16 feet deep, was carried across the whole river 85 feet above the bridge.

"The preliminary stages of the work were begun on the 24th of March, 1886. An earthen coffer dam was built out into the river inclosing the twenty arches at the western end of the Rosetta barrage, which were the arches most seriously cracked. The water within this dam was pumped out, and it was then possible to examine and repair the old foundation. The work done in this first short season was more or less of an experimental character, and there was only time to partially repair six bad floorings. Work began in earnest in 1887, when it was resolved to complete the western half of the Rosetta barrage. One of the chief difficulties that had to be encountered was that the working season was necessarily a very short one. On account of the state of the river flood a beginning could never be made before the end of November. The portion of the barrage which was to be operated upon was first inclosed by great earthen banks forming a coffer dam all round. They had to be made in deep water, and this part of the work always took more than two months. Then the water inside had to be pumped out, and it was considered fortunate if the actual work on the foundations could be begun by the first days of March. It then continued without intermission day and night until the end of June, when the Nile began to rise again. There was not time in each season to repair more than the half of either barrage. The work was, therefore, spread over four years.

"A further difficulty was due to the fact that all the time the barrage was being mended, it was necessary to use it to hold the water up. From the pressure of the water outside springs were constantly breaking out in the floor of the portion from which the water had been excluded, and on one occasion in the last season of all there was a serious risk of the work being interrupted for the rest of the summer, owing to a disaster of this kind. Other difficulties were constantly presenting themselves, especially in the earlier stages of the work. Almost every day some new trouble had to be faced, some new expedient invented.

"By the middle of June of the present year the great work was practically completed. A few further operations had still to be done, but the barrage below the water line was finished. The outlay up to date has been £405,000, and what still remains to be done may bring this amount up to £420,000 as the cost of restoring the barrage. It is almost impossible to estimate with any degree of accuracy the benefits which have accrued, and will, now that the work is finished, accrue to a still greater extent to the country from the barrage. Sir Colin thinks that during the past five years, while the barrage was, as yet, incomplete, the annual value of the cotton crop alone has been increased by over £800,000. It would, however, be somewhat rash to attribute the whole of this to the working of the barrage, though it is evident that, in Sir Colin's opinion, that is a sufficient explanation of the fact."

Mr. Cope Whitehouse, having read the above, writes to the *Times* to correct one of the statements. He says:

"In the letter from a Cairo correspondent describing the great distributing dam repaired by Colonel Western, C. M. G., R. E., and his admirable staff, there is an error of some importance. It is stated that during low Nile 'the water above the barrage is raised and diverted into three main canals, which irrigate the whole of Lower Egypt.' The total cultivable area of Lower Egypt, according to the reports furnished me by Sir C. C. Scott Moncrieff, is about 5,000,000 acres. The cultivated area is 2,800,000 acres. The immense area, amounting to nearly one-half of the delta, cultivated in Pharaonic and Roman days, but neglected for the past 15 centuries, remains unaffected by the barrage, for the simple reason that the summer supply of water for three months of low Nile barely suffices for existing areas. (See Willcocks on Egyptian Irrigation, 1889) The barrage system is capable of handling a very largely increased supply, but the volume of water delivered must be increased by storage reservoirs, impounding a part of the Nile flood, from 20,000,000 cubic meters per day (8,000 feet per second) to at least 50,000,000 cubic meters before the statement of your correspondent can be justified."

THE LARGEST RESERVOIR.

THE *Indian Engineer* says that, omitting lakes, which are in many cases natural reservoirs, the largest reservoir or artificial lake in the world is the great tank of Dhebar, 20 miles southeast of Udaipur, Rajputana, which covers an area of 21 square miles. The masonry dam is 1,000 feet long by 95 feet high; 50 feet wide at the base and 15 at the top. In Southern India also, there are some immense reservoirs. That of Cumbum, is formed by damming the Gundlakamana River by a dam 57 feet high, thrown between two hills. This reservoir has an area of 15 square miles. The Sulekere Reservoir in Mysore is a very little smaller, and, next to Cumbum, is the finest in Southern India.

SEWAGE DISPOSAL AT WORCESTER, MASS.

THE sewage precipitation plant at Worcester, Mass., recently completed under the supervision of City Engineer Allen, and in which the principle of chemical precipitation is used, is described as consisting, mainly, of a series of large open tanks, solidly constructed of brick, and having a combined surface area of about ten acres. There is also a building in which are a mill for grinding the chemicals, and vats in which these chemicals, after being ground, are mixed with a small quantity of crude sewage. This mixture is then discharged into the stream which flows from the sewers into the brick basin, where some chemicals, chiefly lime, combine with some of the impurities, forming a coagulum, which, as it settles, carries with it to the bottom of the basin the other impurities, leaving the clarified sewage. This clarified sewage is then allowed to flow off into the river and the sludge is drawn off from below and deposited on land adjacent to the works, where it will be plowed under, and is expected to cause no detriment to the health or comfort of the neighborhood. The basins are so constructed that all may be used simultaneously, or the flow of sewage may be cut off from any one or more of them for removing the sludge, for cleaning or repairs.

The works have a capacity equal to the daily purification of 9,000,000 gallons of sewage, and the annual cost of their maintenance is estimated at about $20,000.

PRECAUTIONS AGAINST FREEZING OF FIRE APPARATUS.

THE advanced season lends special interest to a notice just issued by the Boston Manufacturers' Mutual Fire Insurance Company, calling attention to the precautions which are necessary to protect fire apparatus against cold weather during the coming winter. Not only is a large amount of damage done to fire apparatus by freezing, but there have been numerous instances in which cold weather has interfered with proper action of some portions of the apparatus, and these difficulties would have been to a large extent avoidable. It is not that the damage caused by frost may be limited to the portion of the apparatus injured, but in many instances breakages of this nature affect the whole fire protective system, and in some instances sufficiently to prevent its efficient use.

The notice in question points out that in the course of this precautionary work for the winter, all hydrants and valves should be carefully examined and oiled, preferably with a heavy mineral oil which will not corrode the brass. All hydrants on stand-pipes and all "Y" or branch hydrants should be opened after the pipes are emptied, to let out any entrapped water which may have leaked past the valve when the pipes were full, care being taken that the drip valves of the post hydrants are in good condition. The rotary pumps should be oiled, and, if exposed to freezing, turned backwards to empty them of water. The pipes exposed to freezing should be emptied, care being taken that the water should be let out from above the check valves, and that all persons who are in charge of such apparatus should know that the gate and drip valves are in order. The drip valves should be marked by an arrow showing the proper direction to open them.

At the last inspection trial of the fire apparatus, the hydrant houses should be looked into and arranged for the winter, attention being given to any lanterns kept hanging there ready for use, and, if necessary, make any changes so that the doors of such hydrant houses cannot be readily obstructed by ice.

If there are any automatic sprinklers in places liable to freezing, and which cannot be kept warm, the pet cocks should be opened after the main valve is closed, and the water drawn off at the drip pipe very slowly, in order that the sprinklers should not be rendered liable to leakage by a sudden change of pressure upon them: this may happen if the water is drawn off rapidly.

When it is necessary to close any sprinkler valves in this manner it is important that every member of the fire department of the mill should be made aware of the fact that these valves are closed, and that it is necessary to open them to provide for the operation of the automatic sprinklers in time of fire.

The necessity of bestowing especial care upon the valves to automatic sprinkler systems is urged upon the attention of every manager. They are frequently reported by the inspectors as shut when they should be open, and were believed to be open. Every valve to automatic sprinklers which is to kept open should be secured in such a position by a leather strap—not a chain—passing around the pipe and one of the spokes of the hand wheel of the valve, the ends of the strap held together by rivets or padlock.

It is preferable that this strap should be loose enough to permit the hand wheel to be moved half a turn, in order that the valve may be turned fully open at any time. It is recommended that such valves be kept a quarter to a half turn from being full open, so as to render inspection possible without removing the strap.

On new sprinkler installations it is recommended that all valves should be provided with an indicator showing whether they are open or shut.

This is one of the most important matters for the protection of manufacturing property, and it is only a matter of chance that the numerous instances of closed sprinkler valves have been revealed by the inspectors and not by fires.

PIPE LINES FOR HEATING AND LIGHTING LONDON.

A PAMPHLET recently issued in England, consists of an "open letter," addressed to Mr. Walter Wren by Mr. T. Howell Williams, on the question of the abolition of smoke, in response to a request made by the former gentleman for a detailed account of a scheme propounded by Mr. Williams for the prevention of fog in London.

Briefly stated, the scheme consists in the production of gaseous fuel at so low a price that it would be impossible in the future to burn coal economically in London. This would be accomplished by making two kinds of gas at the coal fields, closely adjacent to the coal pits; conveying the same, when manufactured, to London in separate systems of main pipes; storing it in convenient holders, and then distributing it for the two distinct purposes of heating and lighting—thus making it a matter of absolute impossibility that coal should be consumed with economy within the radius of the Metropolitan district for the purpose of heating, and preventing its import as a matter of profit.

THE TOKIO WATER WORKS.

CONCERNING the water supply of the city of Tokio, the following, from a recent issue of *The Japan Gazette*, will prove interesting:

"It is nearly 250 years ago that a large canal was constructed from Hamura, some 20 miles or so up the Tamagawa, to lead water to Yedo, and to irrigate the great plain on either side of its course. This canal is a bold piece of engineering work considering the crudeness of the surveying instruments—one might almost say the absence of all surveying instruments—in the country at the time. The water as it enters Tokio is pure, except that it holds some clay in suspension, originating in the sides of the canal, which are not stone lined. The water as it reaches the houses is, for the most part, anything but pure. It is distributed over the whole of the city in wooden pipes, which, for the most part, discharge the water into shallow wells. It is in both the pipes and the wells that the contamination takes place, there being no sufficient safeguard against the soakage of the highly contaminated water of subsoil of Tokio into both these. Moreover, the supply is not of course a high pressure supply. The want of improvement in the supply—or rather in the system of distribution—has been felt for some time, and, to our knowledge, some five or six schemes have been made by foreign and Japanese engineers during the last 15 or 20 years. Some three years ago a company proposed to undertake the work, offering terms that appeared generous enough, but they were not granted a concession, as the authorities were almost unanimously of opinion that such undertakings as the public supply of water should remain in the hands of the municipality. It was considered that in the case of Tokio the work would best come within the control of the City Improvement Commission. Accordingly, about two years ago, a sub-committee of this Commission was formed, with instructions to report to the Commission. Prof. W. K. Burton, of the College of Engineering, Imperial University, a member of the sub-committee, was entrusted with the work of getting out a draught plan of the proposed works. This rough draught was taken by Mr. K. Furuichi, Director of the College of Engineering, to Europe, where it was submitted to various experts in water supply. These, while expressing general approval of the scheme, suggested certain alterations in minor points. On the return of Professor Furuichi the whole question was re-considered by the sub-committee, and Professor Burton was instructed to prepare a revised plan, incorporating certain of the proposed alterations. The modified plan was adopted by the Commission, and received sanction from the Cabinet early this month.

"The population to be supplied at once is estimated at 1,300,000, but the works are to be capable of rapid extension to supply 1,500,000, and eventually 2,000,000. The quantity of water is to average 4 cubic feet per head per 24 hours—about 25 gallons. The work is greatly facilitated by the fact that the water is already brought to the vicinity of the city in a fair state of purity, so that all requiring to be done is to filter it, and to distribute it through iron pipes under pressure. The main works will be at Hamura, a district just outside the city on the northwest, at an elevation of a little more than 100 feet above sea level, where there will be settling reservoirs, filter beds, etc., covering an area of about 100 acres. The purified water will be distributed direct from there to the higher part of the city, pressure being obtained by steam pumps. There will also be two mains, each 42 inches in diameter, carrying water to two other pumping stations intended to supply that part of the town at a level only a little over that of the sea—that is to say, the larger and most populous parts of the city. It is proposed to construct one of these at Shiba, and the other on the elevation where the Imperial University stands. At each of the three pumping stations there will be a clean-water reservoir, holding a half-day's reserve of water. The pumps will pump into mains of diameters varying from 42 to 4 inches. The total length of the mains will be over 400 miles.

"Special attention has been paid to means for the extinction of fires. There will be several thousand fire hydrants, and the diameters of the mains and sub-mains have been so proportioned, that, in the case of a fire, all the hydrants around a burning building will throw water from under pressure. There has been so much variation in the rate of exchange lately, and the price of iron has fluctuated so much, we are told that it is impossible to estimate the price of the work other than approximately. We are told, however, that it will probably be a little on one side or the other of $7,000,000. About one-half of this will be for imported goods, the other half for materials bought and work executed in Japan."

WATER POWER AND ELECTRIC TRANSMISSION.

THE first practical demonstration of electric transmission of power for mining purposes in California has been inaugurated by the American River syndicate, in El Dorado County, an English organization, under the management of Mr. George Cullen Pearson.

According to the San Francisco *Mining Review*, the power station is located on Rock Creek, some 1,500 feet below the mine and mill and two miles distant in a straight line. The plant consists of an 8-foot Pelton wheel, which, running under a head of 110 feet at 100 revolutions with 5½-inch nozzle, has a maximum capacity of 130 horse-power. To this wheel is connected a 100 horse-power Brush generator, speeded at 900 revolutions, the current from which is carried to the mill through a single insulated copper wire, No. 3 B & S. gauge, the return being made by a wire of the same size, making a four-mile circuit. The power from the generator is communicated to the counter-shaft of the mill by a 70 horse-power Brush motor running at 95 revolutions.

The machinery operated consists of three centrifugal roller mills, a ten-stamp battery and a rock breaker The Pelton wheel under these conditions shows an efficiency of 86 per cent., while 85 per cent. of the power thus generated is available for duty at the mill, though only 70 per cent. was called for in the contract with the Brush Company. Sufficient power is taken from the main circuit to run incandescent lamps for lighting the works, the current being cut in by means of the Brush multiple series cut-out box, which admits of incandescent lights being operated by a high-tension current.

The company owning their own water right, the operating expenses of this plant are said to be almost nominal; only one attendant is required at the power station, and this not an electrical expert, but one of the company's employees. If the distance between the generating station and the mill were five or ten miles instead of two, it would simply have been a question of a larger expenditure for wire with a somewhat smaller percentage of power delivered.

This equipment has been in constant operation for five months, no interruption to the service of any moment having occurred during this time. The mills named are handling an average of 4,000 tons of ore per month, effecting, it is claimed, a saving of some 60 per cent. over the former method of working by steam power, estimating wood at 3.50 per cord, while the cost of maintenance is given about as six to one in favor of electricity.

THE Barrett Storage Battery Company, of Springfield, Mass., is reported as building an electric Motor car for street railroad service to be operated by the company's storage batteries. It is to be about 10 feet long, and is to be a locomotive, not a passenger car, simply taking the place of the horses. It will be furnished with 300 cells and two 20 H. P. motors. The mechanism is so arranged that the car can be propelled by either the overhead system or storage batteries.

BUILDERS' AND CONTRACTORS' ENGINEERING AND PLANT.

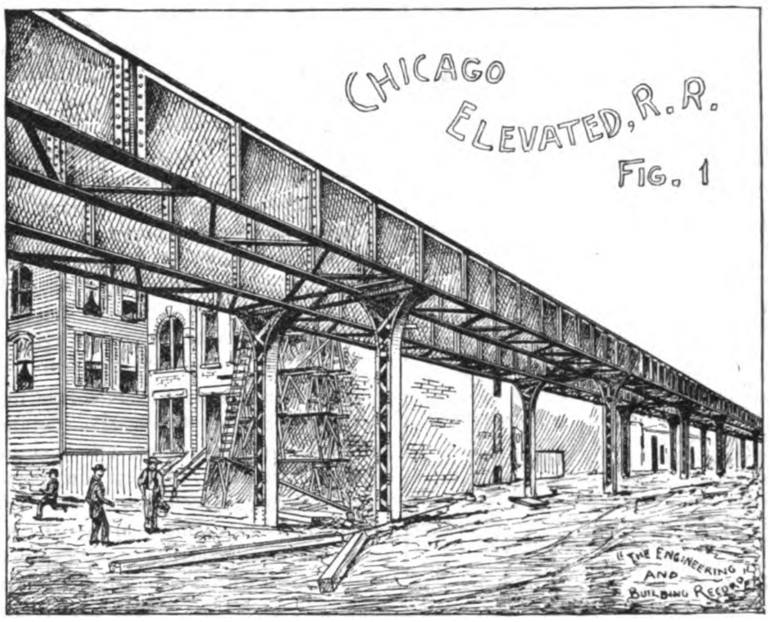
No. CIV.

(Continued from page 344.)

THE CHICAGO ELEVATED RAILROAD ERECTION.

FIGURE 1 gives a general view of the Chicago and South Side structure, whose standard longitudinal spans are 50-foot plate girders, with 4-foot web plates, ⅜ inch thick, 6"x4"x9/16" chord angles, and 4"x4"x½" vertical stiffeners.

There are, generally, no transverse girders, and the cross bracing is of 3x2½-inch L's. Each column is made of a pair of 15-inch 150-pound channels, latticed and spread 5 feet at the top to receive both girders of one track.



CHICAGO
ELEVATED, R.R.
FIG. 1
"THE ENGINEERING AND BUILDING RECORD"

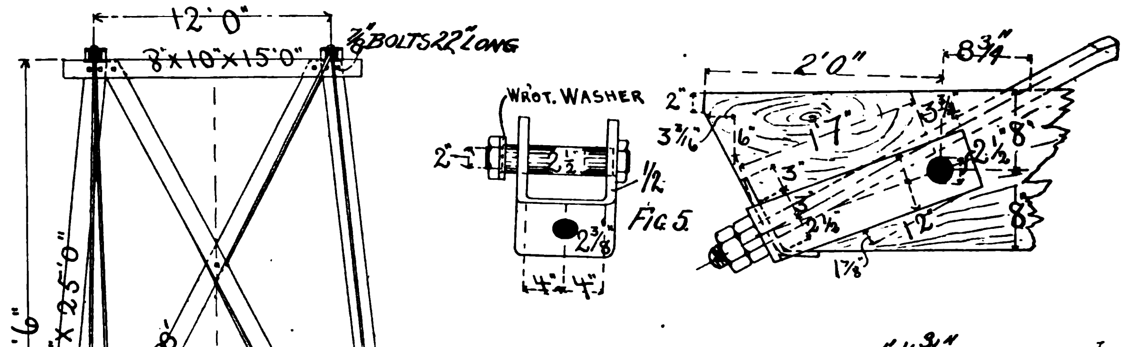


Figure 2 is an elevation, and Fig. 3 is a plan of the traveler designed and used for the erection of this work; Fig. 4 shows, in section and elevation, the right and left sides, respectively, illustrating the tower from X X and Z Z, Fig. 2; Fig. 5 is a detail of the connection at A; Fig. 6 shows the angle bearing at D; Fig. 7 shows the connection at C; and Fig. 8 is a detail of the saddle link at B, which rests on the tower and receives the truss rods on its two pins.

The traveler rolled on six wheels, to the end of the last erected girder I, Fig. 2, to which the following part G was anchored by bolts not shown. The two 60-foot booms F F could each swing nearly 180 degrees around their pivots H H, and by means of hoist E, carried by a trolly running along the boom and operated by steam hoisting gear, the columns could be picked up from their position alongside on the ground and set in place, and the girders put on top of them, and all securely held until connections were made.

The traveler was designed by the Keystone Bridge Company, of Pittsburg, Pa., who also built the iron work.

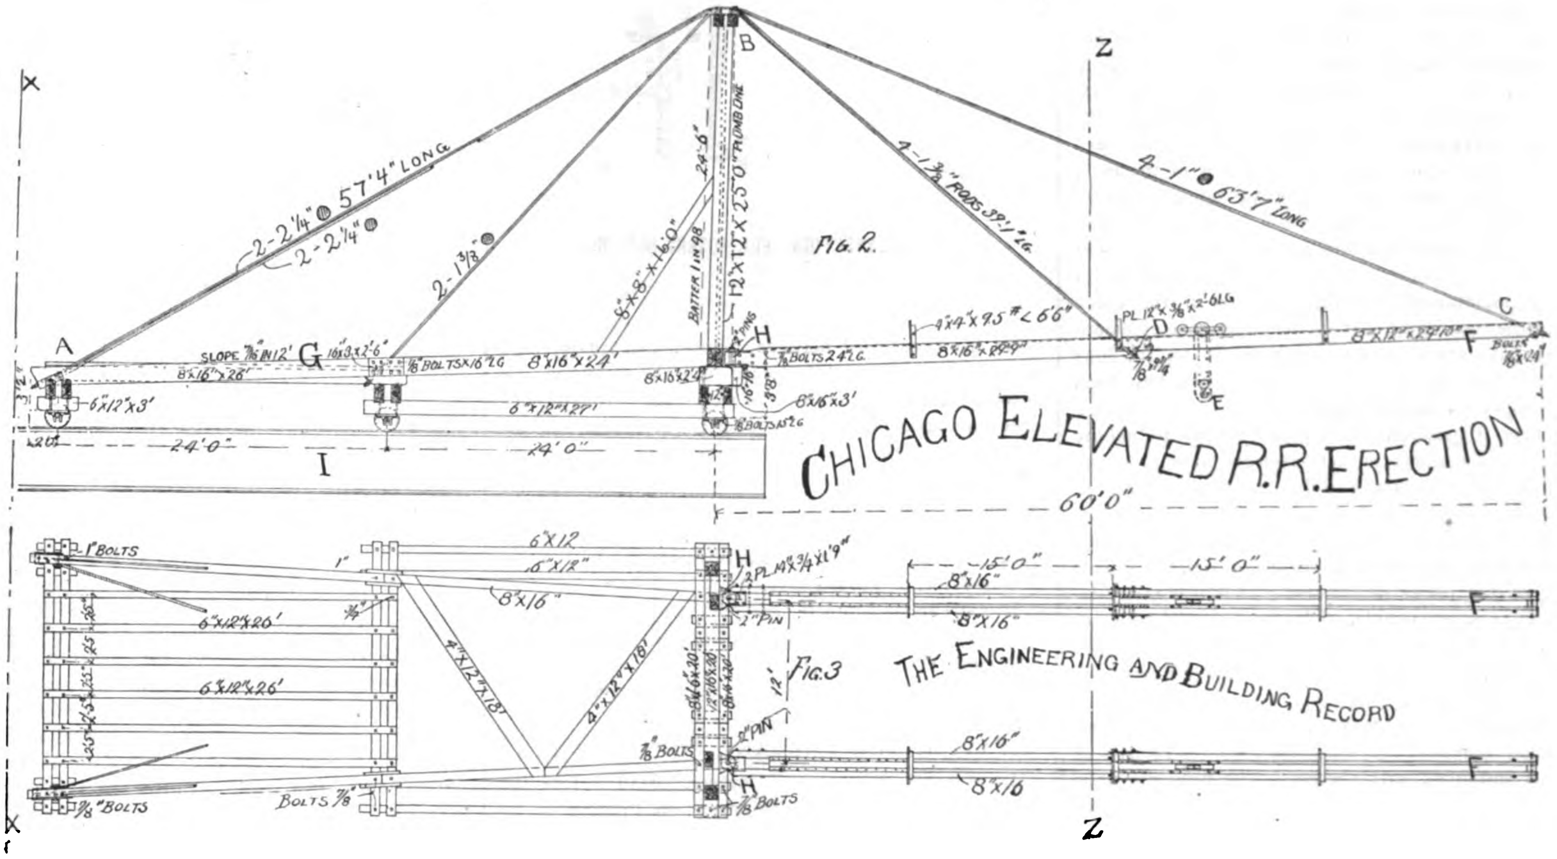
POWER TRANSMISSION BY COMPRESSED AIR.

SPEAKING of compressed air power transmission the London *Engineer* of recent date says:

"The success of the experiment in Paris, however, is the result in a large degree of the excessive cost of fuel in the French capital, and it has not, moreover, been applied to anything like purely industrial purposes. The compressed air has been used rather as a substitute for manual labor in a variety of small miscellaneous applications, than to the displacement of steam or gas power in workshops. The peculiar character of the Parisian industries has also been exceptionally favorable to any system of power transmission by reason of the large number of and individual smallness of the plants. Nevertheless, the Popp installation has produced several new applications of pneumatic power, which are not without significance for the future of the system. Prominent among these is the employment of compressed air for the working of lifts, in which use it is said to succeed even better than hydraulic power. Outside of Paris the most remarkable recent incident in the progress of compressed air as power is the success which the Mekarski pneumatic tramway engine has lately attained in France. The system has recently been adopted for the light line of the Nogentais Railway Company, is about to be employed at Bordeaux and St. Maur, and will probably be extensively utilized on the new agricultural and other tramways now being so largely constructed in France. The broadest view upon the future industrial possibilities of compressed air is, however, that expressed by Herr Georg Schimming, in a paper just read before the German engineers in their annual assembly at Halle. The success of the Popp Company's operations in Paris has been largely due to the association of the supply of compressed air with that of electricity; and Herr Schimming proposes that in Berlin and other German towns it shall be made a branch of the gas-making industry. His fundamental principle is that any method of utilising fuel which allows heat to be wasted, and residual products, to escape, to the extent inevitable when coal is burnt under steam boilers, is a serious loss of energy. He proposes, therefore, that fuel for all ordinary heating purposes should be burnt in the gaseous form, and that the glowing coke taken direct from the retorts in the gas works to the fires of steam boilers should serve to produce the entire motive power of a community in the shape of compressed air. Such an amalgamation of power, heat, and light supply in one central concern would, it is argued, produce an enormous economy in the cost of all three; though it is not said how the exact ratio between the requirements of the retorts and the steam boilers, which is an important feature in this economy, is to be always obtained. The proposal is, at all events, a hiut worth the notice of the gas companies.

THE first electric railroad in Switzerland is about to be opened at Boxholm. The overhead wire system is to be employed, power from a 50 horse-power turbine being used to drive two Wenstrom dynamos.



ANNUAL REPORTS.

SEVENTEENTH ANNUAL REPORT OF THE BOARD OF PUBLIC WORKS OF THE CITY OF GRAND RAPIDS, MICH., for the fiscal year ending April 30, 1890.

The pamphlet contains not only the report of the Board of Public Works, but also the reports of the City Engineer, H. A. Collar, and of the engineer of the pumping works and inspector of water waste. It appears that the average daily consumption of water for the year was 3,315,119 gallons, showing an increase of 22 per cent. as compared with last year. A new and larger pump was put in for high service, a stand-pipe was erected, filtration plant constructed and considerable extensions made in the distributing system.

ANNUAL REPORTS OF THE CITY OF KALAMAZOO, MICH., for the year ending March 31, 1890.

The report of George S. Pierson, City Engineer, states that the separate system of sewerage, which was inaugurated in 1880, has now a total extent of 14 miles, exclusive of connecting sewers. The cost of construction proper has been $75,797.03, an average cost per foot of $1.03.

The system has given good service the past year. There has been one stoppage. This occurred in a 6-inch line in the business part of the city. It has been the custom for several years past to lay laterals not less than 8 inches in diameter, except in the case of extensions of 6-inch line already laid. Six-inch lines, however, have never given any trouble in the residence part of the city.

During the past year all work upon the sewers has been done by the city—no contracts having been made except for house connections.

The cost of the work done during the year, by day labor, is as follows:

Size of Pipe.	Length.	Average. Depth of Cut.	Cost of Lineal Foot.
6 inch.	408 feet.	7.1 feet.	44.8 cts.
8 "	806 "	7.65 "	63.5 "
12 "	395 "	10 85 "	$1 46

A 12-inch main, 4,544 feet long, with a subsoil drain pipe 6 inches in diameter, except for 225 feet at lower end, where it was 8 inches, was also laid during the year. The average depth was 10.27 feet, and the total cost, including drain tile and 13 manholes, was $1.04 per lineal foot. The average cost of house connections was 37 cents per foot.

The report of George H. Chandler, chief engineer of the water-works, briefly reviews the condition of the Water Department, and is accompanied by a number of tables giving the pumping record for the year, amount of pipe laid, hydrants and gates set, location and sizes of water mains, etc. Stress is laid upon the importance of erecting a new pumping engine so as to enable the supply to keep up with the growing demand for water.

NINETEENTH ANNUAL REPORT OF THE BOARD OF WATER COMMISSIONERS TO THE CITY OF NEW LONDON, CONN., September, 1890.

The above contains, in addition to the usual annual report of the superintendent upon the subject of maintenance and repairs, a description of the work for additional supply, carried out from designs and under direction of the engineer, W. H. Richards. This consists of a new iron main nearly five miles in length, and of a water tower, hydraulic motor and pump for high service. The latter were fully described in THE ENGINEERING AND BUILDING RECORD of October 11. This form of hydraulic motor for high service is quite unique, none of the water used in the motor being wasted, as it is all turned into the low service, causing, of course, a little reduction of pressure in the latter. The one erected at New London is, we believe, the largest, and, with one exception, the only motor of its kind.

TACOMA, WASH., is to have new water-works, Charles G. Darrach, of Philadelphia, Pa., being the engineer in charge. A gravity supply system has been determined upon, and it is thought that everything will be ready to begin pipe laying early next year.

Correspondence.

Communications giving information or opinions on matters of general interest to the engineer, the architect, the contractor, or the municipal officer, will be welcomed in this column. Fairness will suggest that when communications are sent simultaneously to this and other journals we should be informed of it at the time. Anonymous letters will not be noticed.

LARGE SIZE VITRIFIED PIPE FOR SEWERS.

SPRINGFIELD, ILL., October 23, 1890.

To the Editor of THE ENGINEERING AND BUILDING RECORD:

SIR: The letter published in THE ENGINEERING AND BUILDING RECORD of October 18, from the City Engineer of Omaha, calls for a reply. Referring to my correspondence, he thinks I am "greatly at fault in recommending sewers 5 feet in diameter and, in some cases, very much larger, to be built of a single ring," and says: "I confess that I cannot see one single reason why a single ring sewer should be a better job than a sewer of the same size constructed of two rings." The idea I intended to convey was, that a single-ring sewer constructed with proper materials and workmanship, was far better than two rings with poor material and faulty construction.

If your correspondent will refer to Trautwine's Pocket Book, he will find that "a rather soft brick will crush under from 450 to 600 pounds per square inch, or about 30 to 40 tons per square foot, while a first-rate machine pressed brick will require about 200 to 400 tons per square foot." Assuming that good sewer brick will sustain a pressure of 200 tons per square foot, and the cement he uses sustains a tensile strain of 14.20 tons per square foot after 25 hours, can he demonstrate that a single ring of a calibre of 5 feet, in clay subsoil and thoroughly constructed is unsafe? The truth is, there is but little weight on the crown, and comparatively little thrust at the spring of the arch after the trenches are filled and the earth becomes thoroughly compact, all that is needed, therefore, is that the best material be used and the best workmanship secured, so as to make the sewers as impervious as possible.

If our public works were constructed with the best materials and workmanship, politics eliminated, we would witness fewer failures and more enduring structures.

For myself, I would much prefer a 12-inch wall constructed as it should be, than a 16-inch wall as it is usually constructed.

W. D. CLARK.

THE Croton Aqueduct, supplying water to New York City, is now practically completed and is in permanent use. All the work left to be done upon it is superficial, and will not require the flow of water to be stopped again, unless possibly for an hour or two.

THE sub-committee of the Philadelphia Council Committee on Railroads, having under consideration the bills granting privileges to three street car companies to erect poles and overhead wires for the purpose of running cars by electric traction, recently gave a public hearing on the subject. The overhead wire and the storage battery systems were discussed without reaching a final decision.

DOMESTIC PLVMBING HEATING LIGHTING & VENTILATION ENGINEERING

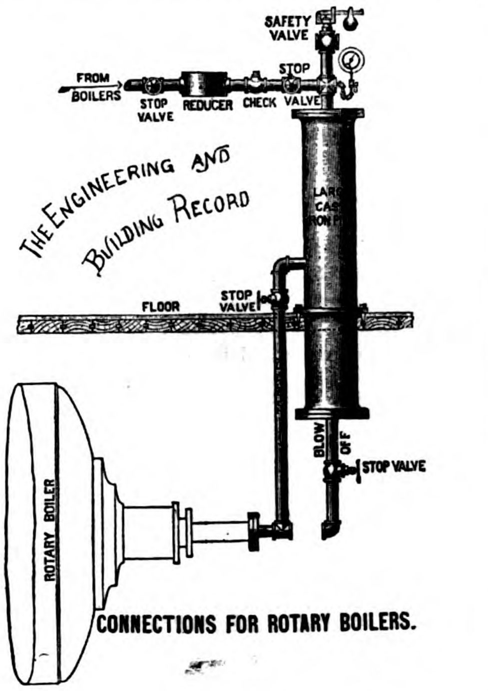
CONNECTIONS FOR ROTARY BOILERS.

WHEN rotary boilers, as used in paper mills, are supplied with steam direct from the steam generating boilers, a great deal of trouble is sometimes caused by the digesting liquor flowing back through the steam supply pipes into the boilers, and into the pipes supplying steam for other purposes, whereby much damage is done to stock in process of manufacture.

This flowing or working back, as explained by *The Locomotive*, is caused by fluctuations in the steam pressure at the boilers. For instance, steam is at 60 pounds per square inch on boilers and rotary; there comes a sudden demand elsewhere for steam, or the fires have to be cleaned, and the pressure falls with comparative suddenness to 40 pounds per square inch in the boilers; the great body of stock and liquor in the rotary is at a pressure of 60 pounds, and temperature due to this pressure; the radiation of heat from the shell of the rotary is not sufficient to reduce the steam pressure as fast as it falls in the boilers, and as a consequence the stored up heat generates steam which flows out of the rotary toward the boilers, and takes along a share of the liquor. Also, when the level of the liquor is above the center of the main journal or steam inlet, as it is always supposed to be when working, the greater pressure of steam in the rotary will force the liquor back through the pipes to an extent depending on the difference of pressures, the length of time it is maintained, and the condition of the check valves in the steam pipe. It is the experience of manufacturers that a check valve will not wholly stop the flowing back of the liquor, and even two or three have been put in without curing the trouble.

Of course, if a separate boiler could be used to boil the rotaries, and no other connections were made to it, the flowing back of the liquor would do no especial harm in many cases. There have been cases, however, where the grease contained in the rags and stock under treatment, and which found its way back into the boilers, has caused burning of the plates of the shell. But it is rarely desirable, or even practicable, to devote a special boiler to the duty of boiling the rotaries, hence some other means must be adopted to prevent damage to stock from the above-described cause.

The annexed cut, reproduced from *The Locomotive*, shows an arrangement that has been tried on rotaries in numerous instances, with success. The principle upon which the apparatus is based, is the use of a reduced pressure in the rotary, so that whatever the pressure in the boilers that in the rotary shall always be considerably less, and thus guard against the possibility of a backward flow of steam and liquor from it toward the steam boilers. The steam coming from the boiler passes through a reducing-valve of any approved make, by which its pressure is reduced to whatever may be considered necessary for the work to be done in the rotary. After being reduced in pressure the steam passes through a check-valve, and then through a stop-valve. It then enters the top of a arge iron pipe, from the side of which a pipe leads off to the rotary. A steam gauge is attached to the large pipe, and likewise a safety-valve, weighted, say, to five pounds more than the reducing-valve is set at. This is to prevent the possibility of the full boiler pressure coming on the rotary, even if the reducing-valve should cease to operate. The stop-valve between the rotary and the large iron pipe should be first closed, when shutting the rotary off, for the following reasons: If the valve between the steam generators and the reducing-valve were shut first, the supply of steam would, of course, be cut off from all points beyond, and the rotary and all the pipe between it and the valve which was shut would begin to cool off by radiation. But owing to the fact that the pipes have a much greater amount of radiating surface in proportion to the volume of steam which they will hold than the rotary has, they will cool off much quicker; and since they are in free communication with the large body of steam and hot water in the rotary, the pressure will be kept up by a flow from the rotary into the pipes. Or we might express the action thus: The steam being shut off the pipes cool quickly, the steam condenses and forms a vacuum; the large body of steam in the rotary has not time to condense, hence the higher pressure in the rotary causes the liquor, and more or less stock, to "back up" into the pipes. The consequence is that the check-valve and safety-valve become clogged with stock and dirty liquor, and if, as would most likely be the case after the operation had been repeated a few times, the check-valve failed to close tightly, the reducing-valve and steam-gauge would be found in the same condition. Where no stop-valve has been used between reducer and rotary, rags have been found tightly forced into the nipple of the steam-gauge, being obliged to pass back through both check and reducing-valves in order to get there.



CONNECTIONS FOR ROTARY BOILERS.

The use of the stop-valve between the rotary and the reducing apparatus and its connections prevents all this trouble. If care is taken to *shut this valve first* when the rotary is to be blown off, no steam, liquor or stock can get back beyond it to clog the safety-valve, check-valve, reducing-valve, or steam-gauge.

It will be understood that the large cast-iron pipe shown in the cut acts as a receptacle or trap for any liquor and stock that may be carried back, the blow-off at the bottom serving to remove all such material from the pipe.

HEATING NEW ENGLAND COTTON MILLS.

IN a paper on "Steam Heating," read before the American Society of Civil Engineers, on October 15, by Mr. W. E. Worthen, the history of the heating of New England cotton mills was reviewed in an interesting manner.

According to Mr. Worthen the earliest cotton mills were heated by hot air furnaces, one at each end of the mills. The mills were about 150 feet long by 50 feet wide, with furnaces at each end with brick flues opening into each story. The furnaces were cast-iron boxes with corrugated top and sides, cast in one piece, and of length to admit cord wood of the usual 4 foot lengths without sawing. The furnaces were inclosed in small brick buildings, arched over with brick, and to protect the mortar joints of this arch from the weather it was covered with sheet lead. As the lead expanded from the heat beneath and from the sun, it hung down from the eaves in fringes, and as it had not cohesive strength enough to draw the fringes back in cooling they hung there till cut off from time to time. Eventually the lead parted at the ridge.

Hot air furnaces with brick flues were put into the houses of the mill agents, and the first church consecrated in 1824 was an example of a closed hot-air circulation. The furnace was placed beneath the center of the church, with the usual hot air chamber of brick, and the cold air duct drew from the end of the church just inside of the doors and the hot air was delivered into the center through an aperture directly above the furnace. At this time wood was the only fuel.

Steam was introduced about 1836. Boilers were placed in the old hot air furnace houses, and the steam pipes were 3 to 6-inch cast iron pipes suspended from the ceilings. The steam and drip connections were of small wrought iron pipe. It has been very difficult to find out when wrought-iron pipe was first introduced. Mr. Worthen gathered from Morris, Tasker & Co., of Philadelphia, that "the butt welded pipe was first made in this country about the year 1830 to 1832." In the early editions of "Appleton's Dictionary of Mechanics," under the head of forging, it is stated: "Musket barrels, when made entirely by hand, were forged in the form of long strips about a yard long and 4 inches wide, but taper both in length and width, which were bent round a cylindrical mandrel until their edges slightly overlapped; they were then welded at three or four heats by introducing a mandrel within them instantly on their removal from the fire. When illumination by gas was first introduced, in a large way, by Aaron Manby, Esq., then of the Horsley Iron Works, old musket barrels were employed for the conveyance of gas. The breech ends of the musket barrels were broached and tapped, and the muzzles were screwed externally to connect the two without detached sockets. From the rapid increase of gas illumination the old gun barrels soon became scarce. This led to a series of valuable contrivances for the manufacture of wrought-iron tubes, commencing with Russel's patent in 1824, under which the tubes were first bent up by hand hammers and swages to bring the edges near together. They were welded between semicircular swages, fixed respectively in the anvil, and the face of a small tilt hammer, worked by machinery, by a series of blows along the tube, either with or without a mandrel. The tube was completed on being passed between rollers with half-round grooves which forced it over a conical or egg-shaped piece at the end of a long bar to perfect the interior surface."

Mr. Worthen adds that in a communication, in 1882, of the late Robert Briggs, Mem. Am. Soc. C. E., to the Institution of Civil Engineers, of which he was also a member, it is stated that the late Joseph Nason of Boston and New York was originator, improver and adapter of much that is essential and now implicity followed in the general arrangement and details of the apparatus employed in the American practice of heating buildings by steam Mr. Worthen states that he knew Mr. Nason very well, and recollects about 1840 he returned from England and endeavored to introduce Perkins' system of heating by hot water circulation through small pipes. He attempted to heat one of the dye kettles of the Merrimac Print Works in this way, but it did not prove a success; but he put hot water apparatus into the houses of some of the agents of the mills, which worked well. He soon turned his attention to steam heating, with the results as given above by Mr. Briggs. With regard to the Perkins system of heating with hot water, there is in the "Journal of the Franklin Institute" for September, 1887, a quotation from a letter from Jacob Perkins written in 1836: "My son Anger is doing well with his patented apparatus for heating by hot water. The system of heating by hot water and steam is being abandoned and the old apparatus removed from various public buildings to give place to the new. This is the case in the British Museum, where Anger has given great satisfaction. It would seem incredible, but it is a fact, that in this apparatus a stream of hot water, which is not thicker than your little finger, carries the heat 700 feet and then returns to the boiler at a temperature of 100 degrees. The boiler is a coil of tubes of the same diameter with the conducting pipe."

The steam pipes as placed in the mills by Mr. Nason were arranged along the inside of the wall and were at first trombone coils; that is, the circulation was through a single pipe, returning by a single half turn or return bend, and so continuously from one end to another according to the number of pipes required. Afterwards branch tees or manifolds were introduced, expansion being provided for by right-angle bends in the pipes at the end of the room. Afterwards these bends were turned up vertically making a miter branch with the branch T horizontal. At present the Boston Manufacturers' Mutual Fire Insurance Company recommend the placing of the coils of steam pipes for heating purposes overhead in mills in almost all cases.

When the steam was first introduced to heat the mills, as already remarked, the small hot-air furnace buildings were used as boiler houses. The boilers themselves were vertical, they were fired by watchmen who had many other duties and carried thick fires, and the feed-water was supplied automatically by balanced floats, which drew water from cisterns in the attics of the mills, supplied by three and five throw, single plunger pumps, driven by the water-wheels. These pumps and cisterns were also used for mill and fire service.

The Merrimack Manufacturing Company, of Lowell; Mass., was among the first to use steam first for power at the cotton mills and afterwards the exhaust for their print works, for the purposes of heating, boiling, etc.

ELECTRIC MOTORS.

(Continued from page 348.)

THE EXCELSIOR MOTOR.

The motor shown in Fig. 23 is made by the Excelsior Electric Company, 115 Broadway, New York. It is made for both arc and incandescent light circuits.

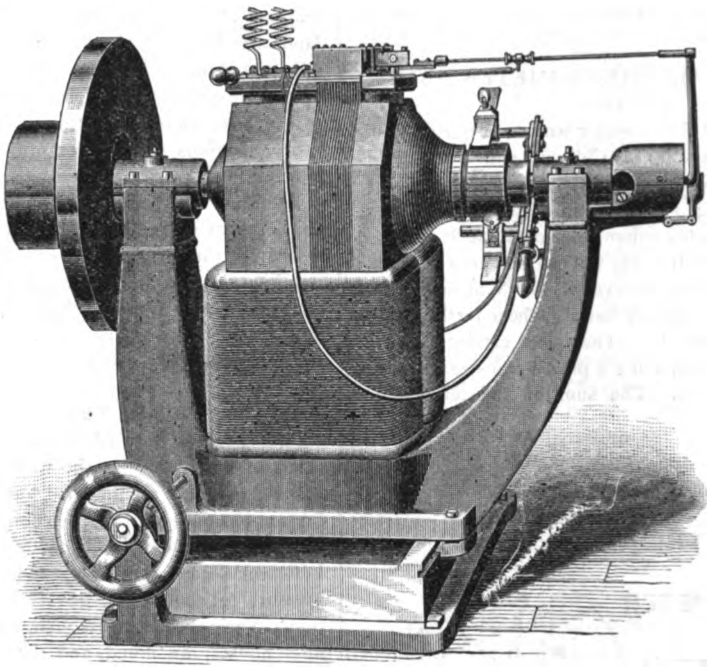


Fig. 23.—MOTOR MADE BY THE EXCELSIOR ELECTRIC CO., NEW YORK.

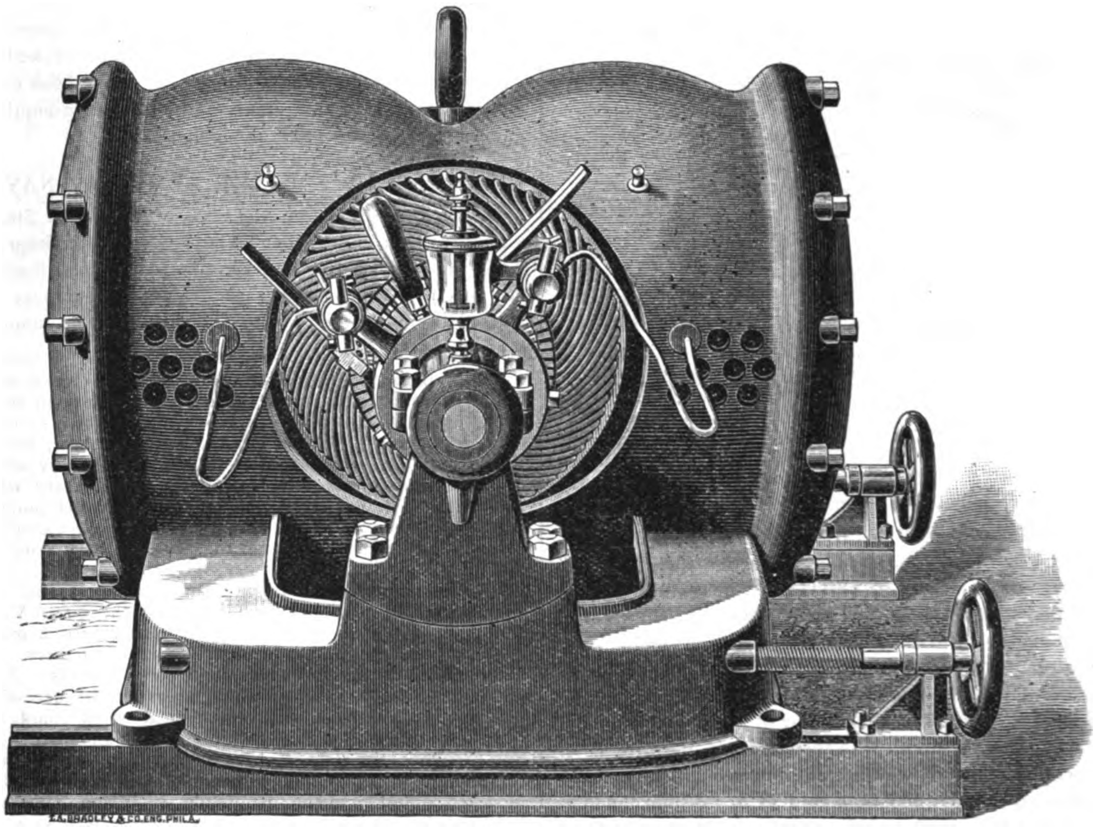


E.A. BRADLEY & CO. ENG. PHILA.

Fig. 24.—MOTOR MADE BY THE WENSTROM CONSOLIDATED DYNAMO AND MOTOR CO., BALTIMORE.

In the arc light circuit, or constant current, motor regulation is effected by a centrifugal governor which controls the strength of the field magnets by cutting out the successive layers of wire in the coils as the load decreases, and cutting them in when it increases. The two main bearings of the motor shaft and the ball and socket bearings of the governor are provided with oil chambers, from which the oil is led to the wearing surfaces by means of felt strips. The armature and field magnet coils are connected in series. The motor is mounted on an adjustable base, and should be given a dry situation.

In the incandescent circuit, or constant potential motor, the armature and field magnet coils are in derived circuit or multiple arc, as it is termed. As the motor is supplied with current under a constant electro-motive force or pressure, it keeps uniform speed at all loads up to the maximum for which it is designed.

In order to prevent an excessive rush of current through the motor, which would take place on account of the low resistance of the armature and the absence of any counter electro-motive force, an artificial resistance must be inserted before starting and withdrawn as soon as the motor has attained sufficient speed. This resistance and a double-pole cut-out switch are mounted in a box accompanying each motor.

The interruption of a large current by means of a metallic switch produces sparks which will corrode the contact points, rendering the switch unreliable. The switches have therefore been provided with carbon contacts, which are kept closed automatically till the metallic contacts are opened. The spark will then appear at the carbon points, where it can do no harm.

The arc light circuit motors are made in sizes from ½ horse-power up to 15 horse-power, and the incandescent circuit motors range from 1 to 40 horse-power.

THE WENSTROM MOTOR.

The Wenstrom Motor is made by the Wenstrom Consolidated Dynamo and Motor Company, of Baltimore, Md., the general agents for the United States being Chadbourne, Hazelton & Co., 416-420 Walnut Street, Philadelphia, Pa. Figure 16 represents a side view.

Generally described, the motor consists essentially of a cylindrical body of cast-iron, closed with heads of the same metal, and resting on a substantial bed-plate. Within, and concealed from view, are four pole pieces projecting toward the armature, on two of which are wound the magnetizing or field coils. The armature is said to be of such construction that great proximity, without touching, exists between the faces of the pole pieces and the surface of the armature. This is claimed to permit a saving in the electrical energy used in the magnetization of the fields, shortening the path, and thereby facilitating the passage of the magnetic lines of force across what in some other forms is a wide air space. The compactness of the motor and its convenient shape for handling, and the fact that the field coils are entirely contained within the iron body of the machine, obviate any risk of damage or breakage under ordinary circumstances in transportation or otherwise. All parts are made readily accessible for inspection or repairs. The armature can be taken out by simply removing one bearing. The field coils which are wound on the heads of the machine, can easily be removed by unbolting those heads. Another claim made for the Wenstrom motor is that a high electro-motive force can be obtained at a comparatively low speed, and that, in consequence, considerable counter-shafting may, in some cases, be dispensed with.

The motors are made in sizes from ½-horse-power up to 100-horse-power for various kinds of work. At present the company are building a number of motors for traveling crane use.

(To be continued.)

LIGHTING THE STREETS OF LONDON.

M. E. Walcott, writing in the London *Architect*, says that in 1661 the streets were directed to be lighted with candles or lanterns by every householder or occupier fronting the main road from nightfall to 9 P. M., the hour of retiring to bed. In the last year of King Charles II.'s reign, one Edward Heming obtained the right of lighting the streets with lanterns placed over every tenth door, from six on moonless evenings until midnight, between Michaelmas and Lady Day. During the reign of Queen Anne, in July, 1708, Mr. Michael Coke introduced globular glass lamps with oil burners, instead of the former glimmering lanterns. In 1716 an Act was passed which enjoined every householder to furnish a light before his door from 6 to 11 o'clock at night, except on evenings between the seventh night of each new moon and the third after it reached the full. In a few years a company was formed to light the streets from 6 o'clock until midnight, each householder who paid poor rates being required to contribute for this purpose six shillings a year. Gas at its introduction, in the beginning of the present century, presented such a novel spectacle to the eyes of the Foreign Ambassadors, that they were vain enough to imagine that the brilliant lamps were only a part of a general illumination to celebrate their arrival.

UNBURNT GASES OF GAS STOVES AND BURNERS.

At the last meeting of the British Association for the Advancement of Science Mr William Thompson presented a paper on the above subject.

Mr. Thompson had originally attempted directly to determine the amount of monoxide, which everybody knows is a dangerous poison; but this proved to be beset with too many difficulties, and the experiments refer to the determination in the combustion gases of unburned carbon and hydrogen, in whatever form they may exist. The flue gases were passed through two U tubes filled with surphuric acid; then through two similar tubes containing soda lime; these would absorb water and carbon dioxide, leaving hydro-carbons, hydrogen, and carbon monoxide to pass through a red hot glass tube filled closely for 15 inches with copper oxide. The coal gas employed was previously dried, and side by side with the experiment were determined the water and carbon dioxide present in the air.

The only burner in which perfect combustion was effected was in paraffin oil lamps when the flame was not turned on full; when the flame was turned on full, unburned gas was liberated to the extent of twelve parts of carbon and three parts of hydrogen for every 1000 parts of carbon completely burned. The next nearest approach was in an Argand burner, also when not turned on full; no carbon and only .25 of a part of hydrogen escaped then, whilst the fully turned-on burner let escape .1 part of carbon and 2.5 of hydrogen. Next in point of perfect combustion ranks Bray's ordinary flat flame burner; here 12 carbon and 1 hydrogen escape. Heating stoves gave much less satisfactory figures, one with three luminous flat burners discharged 97 C and 12 H; eight Bunsen burners playing in a Fletcher stove on fancy ironwork, 146 C and 7 H; twenty Bunsen burners heating asbestos projecting from a fireclay brick, 57 C and 20 H; and a stove in which the burned gases rise to the top of an iron chamber filled with pipes (through which cold air is passed to be heated), and from the bottom of which the gases escape after having considerably cooled, discharged 226 C and 28 H. Smoke particles were not observed in any of these cases, but they would not effect these figures, nor would acetylene and ethylene. The combustion in cooking stoves should carefully be inquired into for sanitary reasons.

Notes and Queries

on Domestic Engineering.

Communications relating to the practical details of plumbing, heating, lighting and ventilation will be welcomed in this column. The writer's true name and address must always be given, but an assumed name may be used for publication if preferred.

PIPING FOR HOT WATER RADIATORS ON BOILER LEVEL.

A. T. ROGERS, New York, writes: "This question has been asked me two or three times within a few weeks, as a test question:

"Supposing a building to be heated by hot water, in which it is necessary to place one or more radiators on the same floor as the heater and others on upper floors, and in which doors, etc., prevent the running of the return pipes along the wall above the floor. If the return pipes drop below the floor, there is produced a pocket of colder water below the bottom of the heater, which will tend to lie stagnant. How will you overcome it?

"The solution proposed by the questioner was this: From the point where the flow-pipe drops to the radiators on the lower floor run a single 1-inch pipe up to the level of the expansion tank, this will give a head which will overcome the stagnant pocket before mentioned.

"Now, to speak plainly, I don't see it. I think that the single pipe running upwards is a waste of material, for no head is produced by it that was not already there, due to the height of the expansion tank. But if the main for the lower floor be run up full size to just below the level of the tank, with an air-cock or air-pipe at its highest point, and then run down again to the radiators, we have a high column of cooler water overbalancing a column of warmer water, and which would tend to overcome the cold pocket below the heater. Upon my suggesting the double pipe, as above, my questioner rejected it because of the expense, substituting the single 1-inch pipe. I have never heard of a job done as he suggested, but have seen a job near New York where this condition exists, and where the connection is like this—upward from the horizontal main at 45 degrees, then horizontal, then vertically downwards to radiator. I have not seen this job work, but am told by the fitter who did the work that the radiator on the lower floor worked as quickly as any on upper floors.

"I have seen jobs where the return has risen from the radiator to pass over doors, etc., dropping again to the heater, and when the descending leg of the syphon was the longer the circulation was generally good. In all such cases as those I have mentioned care is needed to favor difficult branches as against those having straight upward runs.

"I should like to hear the experience of others, as these are somewhat frequent problems."

[A dip, or a "trap," below a doorway, or in crossing a hallway or other passage, is a very common occurrence in hot water apparatus. They should be avoided if possible, but when unavoidable they may be used, and, unless an air pocket is formed that will become air-bound, they offer very little obstruction to the flow of the water. A very feeble circulation may be stopped or further impaired by it, but a good circulation, with ample diameter of piping, will go on unless the air stops it.

A 1-inch pipe, run from the stagnant pocket to the expansion tank, cannot increase the head and will not help the circulation directly. It may act as an air-pipe, however, in some particular case and the person finding the circulation improved attribute the result to the wrong cause. A pipe carried up and down again as you propose will add something to the force of circulation. Its value, however, is overrated, as the "down" side must have nearly the same temperature as the "up" leg if the circulation is rapid. In special cases it helps, but a well-designed job will not be benefited by it. Carrying the return pipe over obstacles is not good. It can be done, however, but care must be taken to take off the air at every point.]

Novelties.

Devices are described under this head purely and strictly as news; because believed to be new and calculated to interest readers.

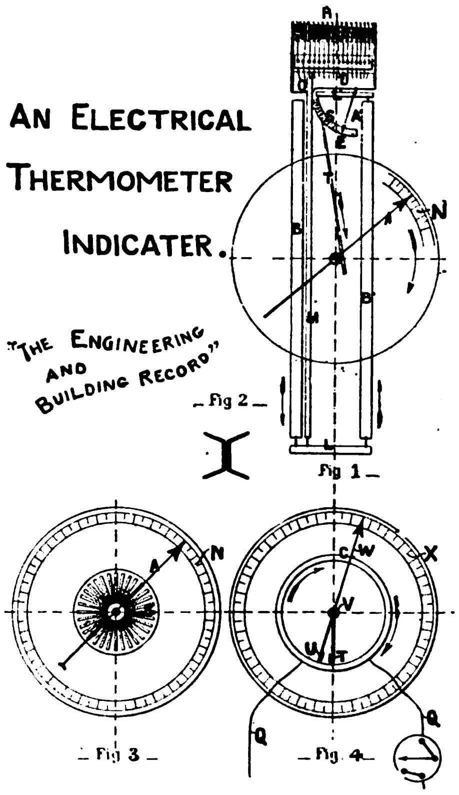
In no case is pay accepted, directly or indirectly, for publishing a novelty notice.

As the subjects are selected for their supposed novelty and interest merely, it will, of course, be understood that the selection does not imply indorsement.

AN ELECTRICAL THERMOMETER INDICATOR.

A SPECIAL form of thermometer with an electrical indicator has been invented by M. Chibout, and is described in the Paris *Genie Civil*, substantially as follows:

Two bars B B', Fig. 1, with a stiff cross section, Fig. 2, are made of some highly expansible metal, such as rolled zinc. One of the bars B is fixed at one end to a bed-plate O, and at the other end to the lever L, which, at its opposite extremity, carries the second bar B', whose farther end is connected to the lever L'. The latter carries a bar T, provided with a rack engaging a pinion whose axis carries the indicator needle A. The sum of the temperature elongations (of bars B and B') is multiplied by the levers L and L', and moves bar T in the direction shown by the arrow, and indicates it, still further magnified, by the needle A. An arc S has insulated copper points corresponding to the graduations of the scale R, and is traversed by a needle A', attached to lever L', and adjusted to maintain on it a position exactly corresponding to A on the arc N. When A' touches any of the copper points E it completes the circuit with the corresponding wire D of a set of circuits R, which are connected with the indicator. The latter may be placed at any distance, and is shown in Fig. 4, where C is a circular solenoid receiving, through wires Q Q, the current from circuits R.



There are at R as many circuits as there are degrees of graduation on the Scale N, each circuit having a different resistance, and, therefore, sending a current of different intensity through C when contact is made at E; U and T are bars of iron, the latter fixed and the former attached to needle W, pivoted at V. When the electric current passes through C, U and T become magnetized and repel each other proportionately to the strength of the current. The needle W, is, therefore, easily adjusted so as to take the same relative position on its scale X that A' does on S, and indicates the same reading as is shown on the thermometer scale N.

Figure 3 shows a simpler arrangement, where the arc S is concentric with the thermometer dial, and its needle A is supplied by needle A, Fig. 1. In Fig. 1, M is a rigid bar forming part of bed-plate O, and the fulcrums and connections of the bars and levers are made of thin, metal plates, indicated by black lines.

The arrangement is claimed to be susceptible of increased sensitiveness by changing the form of solenoid C.

BOOK NOTICES.

NOTES ON GAS-LIGHTING AND GAS-FITTING. By William Paul Gerhard, C. E. 50 pages. Size 5x7 inches.

The above pamphlet is reprinted from detached papers, previously published by the author. The sanitary, economic, scientific and mechanical aspects of the subject and its general conditions, and the main features of ordinary practice in this country and in England, are discussed at some length, and accompanied by numerous hints to builders. They are followed by a form of specification for gas piping, and a score of suggestions to gas consumers, about the use of gas and fixtures and the precautions suitable for ordinary conditions or emergencies.

Attention is called to the importance of good work, and the necessity of having it carefully laid out and thoroughly tested; to the arrangement of pipes and valves, and the requirements for them; to making joints, supporting and exposing pipes, draining them, and methods of testing. The matter bearing on this last point is reprinted from THE ENGINEERING AND BUILDING RECORD, Vol XI., page 501. The author also describes English practice by quoting from William Easie, sanitary engineer. Considerable space is devoted to the cause and effect of gas leaks, to which, besides the waste, danger of explosions and sickness are attributed. Various precautions against fire are recommended. The composition of gas, its combustion and the conditions of illumination, are discussed. Different forms of burners and globes, and the use of pressure regulators and governor burners receive attention. Various defects, frequent in the gas fitting of common houses, are noted, and the specifications cover the pipes, joints, valves, stop-cocks, risers, outlets, location of distribution pipes, method of fastening, height of brackets, length of nipples, pressure test and inspection. A table of the size and greatest length of pipe allowed to supply up to 500 burners, is also given. The book concludes with an estimate of average burner consumption and hints for the reduction of high gas bills.

ELECTRICIANS FOR THE ARMY AND NAVY.

LIEUTENANT BRADLEY A. FISKE, of the United States Navy, gave an address on "The Modern Electrician in Time of War," before the New-York Electrical Society last week. After showing the value of electricity as applied to modern warships, the lecturer said, among other things.

"I propose the formation of a corps of naval and military electricians to assist the Army and Navy in their work. Such a corps might exist in every principal seaport town on the coast, the principal corps, of course, being the one with headquarters in New York. Electricity being now a recognized factor in both naval and military war, and requiring expert electricians for its full development, there would seem to be just as much reason for an electrical corps in the National Guard of the State of New York as for infantry, artillery, or cavalry.

"Those members volunteering for naval work would be equally useful. The ordnance officer at the Navy Yard would constantly find himself overwhelmed with a mass of work which he would be utterly unable to carry out without the assistance of some such corps as this. And for the reason that electrical engineers are of necessity mechanicians, a great deal of technical work could be intrusted to them, such as the arrangement and fitting of gun-carriages, the storage of ammunition, the assembling of guns, etc. Their more immediate and obvious field, however, would be in the installation and fitting of electric lights, motors, telegraphs, telephones, and other electrical appliances, on board the vessels of war, constantly called into requisition. In the matter of fitting out merchant steamships their usefulness would be at once apparent. Now, as the work of fitting out ships with electric and ordnance equipment calls for technical knowledge and experience of a high character, it is obvious that a corps of well-trained technical men, such as is here suggested, would be more than useful; it would be necessary."

A GIGANTIC pendulum has been suspended from the center of the second platform of the Eiffel Tower at Paris. It consists of a bronze wire 380 feet long, with a steel globe weighing about 198 pounds at the end. Its object is to exhibit the rotation of the earth by the Foucault method.

THE MAINTENANCE AND OPERATION OF WATER-WORKS BY PRIVATE COMPANIES.

(Continued from page 326.)

8. SHUT-OFF ORDER. Color, pink. Record No. 913.

If water is to be shut off for any purpose other than in case of accident, repair, or change of connections or fixtures, when the licensed plumber or foreman of the service department may do it without a permit, a shut-off order must be given to the Inspector, who will shut off the service, read and note the number of the meter, if there is any, and return the order to the office, dated and signed.

Transcripts will then be made from it to the rate and other necessary books, and the order filed away according to the stop number.

9. SHUT-OFF BOOK. 13¼ inches long, 8 inches wide. 180 pages. Horizontal rulings, 3 to the inch. Record No. 938.

This book will be used to note the times of turning on or shutting off any stop.

Fill in in the left-hand column the stop numbers in regular numerical order, using every third line only. There will then be twelve numbers on a page, and each number will have three lines and twelve double columns for the entry of different dates of turning on or shutting off any stop. Also give owner's name and page in Rate Book.

When any stop is turned on for the first time, enter the date in the first half of the first double column, and, if it is ever shut off, note the date and the reason in the other half of the first column; then, by following down this column, all stops that are shut off can be seen at a glance. If the stop is ever turned on or shut off again, enter the date in the next column, and so on.

To indicate the reasons for shutting off any stop, use the following letters:

P, for penalty, or failure to pay bills or conform to the rules and regulations.

V, for vacancy.

R, for request of owner, by reason of temporary absence or otherwise.

D, for dead—*i. e.*, the stop is permanently out of use, by reason of the building being moved, burned, or for other reasons.

If the ownership changes, cross out the old name and insert the new one.

10. REPAIR NOTICE. Color, blue. Record No. 914.

Whenever the water is to be shut off from any section of the works, large or small, for an hour or more, notice must be given to each party having connection with the works by leaving one of the "repair notice" slips at the door as long in advance as possible.

In case of accident, when no notice can be given in advance, the Inspector must go at once to each house having hot-water boilers connected with the works, and give the necessary instructions in regard to the same, and prevent damage.

11. RECORD BOOK. 13¼ inches long, 8 inches wide. 334 pages, containing 1,000 records. Record No. 934.

Each page will contain the records for three premises; and the diagrams will be filled in as indicated, together with such changes, alterations, etc., as may be necessary from time to time.

The records will be made according to the stop numbers, three on a page.

If more than one book is needed on any one works, the stop numbers will continue from one to another, and each book will be numbered on the back and side, giving the range of the numbers it contains.

12. METER BOOK. 13¼ inches long, 8 inches wide. 180 pages. Horizontal ruling, 3 to the inch. Record No. 939.

Use this book to keep a record of each meter received.

Give a proportionate number of pages to each size used, commencing with the smallest. Then again divide these pages proportionately among the different kinds of meters in use, heading as many pages as needed with the name of the meter or the maker's name, whichever it is known by commercially, and the size of the meters on that page. Then, under the appropriate size and name, enter each meter in the order of its shop number. If any meter should be received out of the order of its shop number enter such number in red ink, so it may readily catch the eye. All meters should be entered as soon as received, whether set or not. The pages left blank will answer for additions or any new meters that may be introduced. On the first page of the book make a list or index of pages where different sizes and makes commence.

Leave three lines between each entry, so as to give four lines for each meter, which will provide ample room for all the different changes which any meter will probably be subjected to.

When meters are set or removed, enter the proper data in the different columns, as indicated.

13. METER READING BOOKS. 4 inches by 7 inches. 180 pages each and index. Record No. 935.

These books are to be used by the persons reading the meters to note the name of the owner, location of the premises, name, size, and number of the meter, date of reading, and the reading.

In large works, several books may be necessary, each one covering a certain section of the works, and the readings taken and entered in the natural order in which the meters will be read, without regard to alphabetical or numerical order.

In small works, one book will be sufficient. Each book provides for 32 readings of each meter.

Each book should be indorsed on the outside with its number, the number of the division of the works for which it is used, and the date when the first reading was had.

Each page will be numbered, and the index in the front of each book will refer thereto.

This index should be arranged by streets, in the order which experience shows to be the most convenient for progress in reading, the order of the street numbers to be preserved in filling in (either backward or forward, as necessary), with an extra line between each name (unless adjoining property), so that any new meter can be properly placed.

[To be pasted in front of "Meter Reading Book."]

DIRECTIONS FOR READING METERS.

Observe carefully whether the dial indicates cubic feet or gallons, and so note in the proper heading in the book.

Observe the arrangement of the dials, and begin to read at that dial which indicates the least quantity, unless that dial should represent but 1 cubic foot or 1 gallon, in which case disregard it.

The figures at the top of each dial represent the maximum reading of that dial, thus, a dial having the figures 10,000 over it means that one full revolution of the pointer indicates 10,000 cubic feet or gallons, as the meter may read, and each subdivision of the dial represents 1,000 cubic feet or gallons.

Read the first or smallest dial, and set down in the right-hand column the figure which the pointer has last past. In the second column set down the figure on the next largest dial which the pointer has passed, and so on.

14. INSPECTOR'S BOOK. 4 inches wide, 7 inches long. 216 pages. Horizontal ruling, 3 to the inch. No special ruling, but a head line. Each page numbered. Record No. 936.

To be used as a pocket memorandum book by the Inspector to note size, kind, location of fixtures on any premises, and anything else which is necessary to be remembered and reported to the office.

Entries will be made in successive order without regard to alphabetical or numerical arrangement; and, as soon as the same is reported to the office or otherwise attended to, be crossed off of the book.

Each entry should be properly dated and signed by the party making the inspection.

15. COMPLAINT BOOK. 8 inches by 13¼. 270 pages. Record No. 937.

In the Complaint Book enter all complaints from customers, or reports of matters needing attention. All entries to be dated, and name of party making report, or complaint, entered.

This book should lie on the Superintendent's desk, and be accessible to all.

It should be frequently examined by the Superintendent, and every entry attended to as soon as possible, either by the Superintendent or by such other person as he may designate.

When any matter has been attended to and finally disposed of, a minute, stating what was done and by whom, should be made opposite the original entry.

(TO BE CONTINUED.)

CONTRACTING INTELLIGENCE

For works for which proposals are requested see also the "Proposal Columns," pages i-ii-370

WATER.

For Additional Water Items see Proposal Columns.

PITTSFORD, VT.—The Town Clerk at this place writes: "Nothing has been done regarding the water-works project except to introduce a bill into the Legislature of Vermont granting a charter incorporating the Pittsford Aqueduct Company. The bill has passed the House, reported to the Senate and referred to the General Committee."

NORTH KNOXVILLE, TENN.—A committee, with Mayor Gratz as Chairman, has been appointed at this place to draw up an ordinance granting a franchise to a company, which proposes to establish a system of water-works at this place.

SIOUX CITY, IOWA.—The Water-Works Committee has reported that it is necessary to proceed at once with the projected water-works extensions, the cost of which, the committee estimates, will be $20,000. City Engineer Wingeland can furnish particulars.

KEY WEST, FLA.—Reports say that the charter of the Key West Water Supply Company has expired, and that steps will be taken by the city to establish a water-works system of its own.

PLAINFIELD, N. J.—Reports say that the franchise and property of the Plainfield Water-Works Company has been bought by the Plainfield Water Supply Company, and that the latter corporation has awarded contracts for the completion of the water works by next spring.

OTTAWA, ONT.—The residents of Rideauville, a suburb of this city, have petitioned the water-works company, asking that they may be allowed to connect with the city water mains. The request has been granted. For additional particulars address the Rev. L. N. Chanpeau, as above.

WHEATLAND, IA.—An additional water supply is projected for this place. Address the town clerk for particulars.

GEORGETOWN, COL.—A special election has been called here, November 12, for the purpose of voting bonds to the extent of $36,000 to construct new or purchase the present water-works at this place.

BLUFFTON, ALA.—The water-works system projected for this place will soon be established.

CATONSVILLE, MD — The Catonsville Water Company will, it is reported, issue $30,000 of bonds for improvements, etc.

MOUNT TABOR, ORE.—The Mount Tabor Water and Light Company has been incorporated. The directors are: Messrs. J. H. Smith, J. C. Moreland and others.

GRENADA, MISS.—The citizens of this place are soon to decide upon the issuance of $20,000 of bonds for the construction of water-works. The Mayor can furnish particulars.

ZANESVILLE, O.—Reports say that the taxpayers of this place will vote next month upon the question of spending $175,000 for the improvement of the water-works.

BELVIDERE, ILL.—The officials of this place will advertise for bids for putting in a water-works system, the intention being to begin operations soon.

LA GRANGE, GA.—It is reported that the officials of this place will ask the next Legislature for authority to issue bonds to the amount of $50,000, the proceeds of which to be applied to the construction of water-works.

WOONSOCKET, R. I.—This place has appropriated $25,000 for the extension of the water system to Manville, a suburb.

STOCKTON, CAL.—The Stockton Water Works Company has been incorporated with a capital stock of $500,000. Address W. S. McMurty, Los Gatos, for particulars.

LEXINGTON, NEB.—By telegraph to THE ENGINEERING AND BUILDING RECORD, November 7, 1890. "The opening of proposals for constructing the water-works system here has been postponed until November 20."

(Continued on page 368.)

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

THE ENGINEERING AND BUILDING RECORD,
277 Pearl Street, New York.
November 8, 1890.

CONTRACTING INTELLIGENCE.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." *Information of importance sent to us exclusively, and not elsewhere published will be liberally paid for.*

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source

WATER.

FOR ADDITIONAL WATER ITEMS SEE PRECEDING PAGE.

ATLANTA, GA.—At a meeting of the General Council, held November 4, the contract for furnishing a quantity of cast-iron pipe and special castings was awarded to the Howard-Harrison Iron Company, of Bessemer, Ala., at the following figures: Pipe, $22.24 per ton; special castings, 22½ cents per pound. The award was made with the proviso that the bonds for the proposed improvement are issued. In connection with the award it was stated that the furnishings contracted for would be required for either of the two schemes contemplated.

LANCASTER, PA.—The Water Committee of the Common Council has recommended that water meters be used in connection with the water-works service, in order to prevent the excessive waste which, it is said, prevails at present.

WATER-WORKS.—See our proposal columns for information regarding water-works and water-works furnishings at the following places: San Angelo, Tex.; Lexington, Neb.; Topeka, Kan.; Ellsworth, Kan.; Galt, Ont.; Chambersburg, Pa.; Harrison, O.; Chester, S. C.; Chambersburg, S. D.; Huron, S. D.; Norfolk, Va.

SEWERAGE.

For Additional Sewerage Items see Proposal Columns

ATLANTIC CITY, N. J.—Reports say that the sewerage company at this place will put in a new 5,000,000 gallon pump.

KNOXVILLE, TENN.—The cost of the proposed system of sewerage for this city according to plans just submitted, is $210,000. Chairman Gleason, of the Board of Public Works, can furnish information.

MARQUETTE, MICH.—Improvements are to be made to the sewerage system of this place.

BRUNSWICK, GA.—Several miles of sewers are to be added to the system of this city.

CHICO, CAL.—Plans for a sewerage system for this place are now being prepared.

MINNEAPOLIS, MINN.—City Engineer Rinker has been directed to advertise for proposals for furnishing the city with 2,000,000 sewer brick.

ATLANTA, GA.—Extensions to the sewerage system of this city have been authorized by the Common Council, the cost of which will be $95,000. Address Alderman Haas for particulars.

MERIDEN, CONN.—The sewerage committee recommends that immediate steps be taken towards establishing a system of sewers. Mayor Page can furnish particulars.

GRAND RAPIDS, MICH.—Numerous sewer extensions are to be made at this place.

SEWERS.—See our Proposal Columns for information regarding sewer construction at the following places: Suspension Bridge, N. Y., Victoria, B. C.

BRIDGES AND IRON STRUCTURES.

For Additional Bridge Items see Proposals Columns.

ALLEGHENY, PA.—A bridge is to be erected over Lacock Street, this city, by Messrs. Marshall, Kennedy & Company.

NASHUA, N. H.—Efforts are being made to establish another bridge over the Nashua River, at this place. The City Clerk can furnish particulars.

CINCINNATI, O.—Reports say that a scheme is about to mature to erect another bridge between this city and Covington. Address the Mayor, as above, for particulars.

GENEVA, N. Y.—There is a movement to substitute arched bridges for all bridges now crossing the creek, in this city.

SCRANTON, PA.—The bridge question continues to be agitated at this place with chances greatly in favor of establishing the proposed structures.

LANCASTER, PA.—The County Commissioners have decided to make extensive improvements to the bridge at Eden, over the Conestoga.

ATLANTA, GA.—The Mayor has appointed a committee to investigate the subject of erecting a bridge over Forsyth Street, and particulars can be obtained by addressing Alderman Hirsch, as above.

SPOKANE FALLS, WASH.—The City Clerk of this place has been authorized to advertise for the stone work on the Monroe Street bridge. Address Alderman Natbohm for particulars.

BOSTON, MASS.—The abutments for Dean Street bridge, at Brookline, have been let to D. H. Cram, for $8,331. The superstructure will be built by the B. & A. R. R.

WHITESBOROUGH, TEX.—The County Commissioners of Grayson County have been asked to build a bridge at this place.

BRIDGES.—See our Proposal Columns for information regarding bridge construction at the following places: Joliet, Ill.; Zanesville, O.; Columbus, O.; Marble Falls, Tex., Willimansette, Mass.; Hamilton, O.; Philadelphia, Pa.

NEW DEPOTS.

BASIC CITY, VA.—The Norfolk and Western Railroad will erect a depot at this city, to cost $25,000.

HUNTINGTON, W. VA.—The Ohio River Railroad Company will soon erect a new depot at this place.

CINCINNATI, O.—The "Big Four" Railroad Company will build a large freight depot on the old Union Base Ball grounds at the foot of Bank Street. Engineer Read, of the Central Union Depot and Railroad Company, will have charge of construction. The proposed cost is $150,000.

CHURCHVILLE, PA.—This place is to have a new depot.

SOUTHAMPTON, PA.—A new depot is to be erected at this place.

STREET-WORK AND PAVING.

HELENA, MONT.—Considerable street work is contemplated for this city. Address Mayor Bradford, for details.

LINCOLN, NEB.—Considerable street paving is to be done in this city.

GAINESVILLE, TEX.—Street improvements, to cost $30,000 are to be made in this city.

MINNEAPOLIS, MINN.—Oak Grove Street, about eight blocks long, will be paved with asphalt.

LANCASTER, PA.—Considerable street paving is to be done at this place, the particulars of which can be had by addressing the City Clerk, as above.

McKEESPORT, PA.—Numerous streets of this city are to be paved, graded and otherwise improved.

GAS AND ELECTRICITY.

BAY CITY, MICH.—It is proposed to increase the capacity of the electric light plant at this place, at an expense of $900. Address the Mayor for particulars.

DAYTON, KY.—The officials of this place have decided to establish an electric lighting plant at once.

PUYALLUP, WASH.—Electric lights are to be introduced at this place.

GRAPEVILLE, PA.—An electric light plant is to be erected at this place by the Electric Supply Company.

SANTA FE, N. M.—This place is to introduce a system of electric lights at once. Address the Hon. T. B. Catron, as above, for particulars.

LOCK HAVEN, PA.—The Lock Haven Electric Light and Power Company is about to establish a plant at this place. Address J. E. Kelly, as above.

MARION, PA.—An extensive gas plant is to be established at this place, at a cost of $50,000. Address M. C. Watson, for particulars.

LA GRANGE, GA.—Electric lights will soon be introduced at this place.

WARSAW, N. Y.—The Board of Trustees has granted an electric lighting franchise to George C. Otis and Elmer E. Rowe.

ELECTRIC RAILWAYS.—New electric railways are projected and improvements are to made to those already established at the following places: Lowell, Mass.; Helena, Mont.; College Point, N. Y.; Little Rock, Ark.; New Utrecht, N. Y.; Rochester, N. Y.; Cairo, Ill.; Wilkesbarre, Pa.; Nebraska, Va.; Chicopee, Mass.; Meriden, Conn.; Ogden, Utah; Jamaica, N. Y.; Philadelphia, Pa.; Atlanta, Ga.; Ottawa, Ont.

NEW CORPORATIONS.

RIVERSIDE, CAL.—The Gage Canal Company has been incorporated at this place, with a capital stock of $500,000. Address Mathew Gage for particulars.

ASTORIA, ORE.—The Astoria Electric, Power and Transit Company has been incorporated at this place; capital stock, $150,000. Address A. P. Sharpstein, as above, for particulars.

BIDS OPENED.

MINNEAPOLIS, MINN.—The contract for the remodeling of the Holly Flour Mill has been awarded to the E. P. Allis Company, of Milwaukee, at $40,000.

GOVERNMENT WORK.

MARE ISLAND, CAL.—The following bids for doing certain dredging work at the navy yard were received by N. H. Farquhar, Chief of Bureau, October 28: William H. Beard, Brooklyn, N. Y., 17½ cents per cubic yard; R. G. Packard, New York, 22 cents per cubic yard. Contract awarded to the lowest bidder, Wm. H. Beard; 10,000 cubic yards to be dredged.

WASHINGTON, D. C.—The following proposals for the construction of two life saving stations, one on Fenwick Island, Del., and the other near Ocean City, Md., were opened November 5 by Horace L. Piper, Acting General Superintendent. The figures given are as follows: 1, Fenwick Island; 2, Ocean City; 3, price for both. Bidders: A. A. McCullough, Norfolk, Va., 1, $9,000; 2, $9,000; 3, $17,500. A. F. Blossom, New Bedford, Mass., 1, $5,714; 2, $5,714; 3, $11,428. J. H. Coster, Jefferson, Tex., 1, $5,390; 2, $5,390; 3, $10,780. Isaac F. Rotan, Philadelphia, Pa., 1, $6,900; 2, $5,900; 3, $12,800. Lilliston & Nock, Accomack C. H., Va., 1, $5,663; 2, $5,363; 3, $11,026. Hudson & Dillon, Philadelphia, Pa., 1, $5,100; 2, $4,961; 3, $10,061. Wm. H. Virden, Lewes, Del. 1, $4,850; 2, no bid, 3, $9,700. Rowland A. Robbins, New York, 1, $4,793; 2, $4,683; 3, $9,293.

PORT ROYAL, S. C.—The following proposals for the construction of a timber dry-dock at the naval station, at this place, were opened November 1 by the Navy Department: Justin McCarthy, Washington, D. C., $418,915; R. G. Packard, New York, $471,000; J. E. Simpson & Co., New York, $497,539; Charles J. Stalbrand, Charleston, S. C., $326,000. No bids were received on the Department's advertisement for a floating dock at same station, and a re-advertisement will be necessary.

WASHINGTON, D. C.—The following proposals for the construction of a bathing room, for the male workhouse, have been opened by the District Commissioners: J. R. Young, Washington, D. C., $7,423; James L. Parsons, Washington, D. C., $7,494; Halliday & Richardson, Washington, D. C., $7,378; James Hughes, Washington, D. C., $8,970; D. T. Mocaber, Washington, D. C., $8,279; A. W. Sweeney, Washington, D. C., $8,558; John H. Bird, Washington, D. C., $7,404. Appropriation for this work is $5,850, and the Inspector of Buildings will curtail the specifications so that the lowest bidder can get the contract.

NEW BEDFORD, MASS.—The following proposals for the erection and completion, except heating and approaches, to the United States Custom House and Post Office at this place were opened November 5 by the Supervising Architect of the Treasury Department: E. Irving Bell, Portland, Conn., $90,850; Samuel C. Hunt, New Bedford, Mass., $97,000; George W. Gay, New Bedford, Mass., $102,000; Darlington Bros., Worcester, Mass., $99,656; Justin McCarthy, Washington, D. C., $109,209.

INDUSTRIAL.

MOUNT HOLLY, N. J.—Reports say that the project to construct a ship canal across New Jersey, from the Delaware River to the Atlantic Ocean, is meeting with considerable success. The exact route has not been settled, but it is thought it will pass near this place and enter the ocean near Shark River.

C., October 17, 1890.—Sealed proposals, in triplicate, for **DREDGING** in the Potomac River at Washington, D. C., will be received at this office until 12 M. on TUESDAY, November 25, 1890. The attention of bidders is invited to the Acts of Congress approved February 26, 1885 and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. For specifications, forms of bid and other information, apply at this office. PETER C. HAINS, Lieut.-Col. of Engineers. 24

PROPOSALS FOR DREDGING.—UNITED States Engineer Office, Mobile, Ala., October 20, 1890.—Sealed proposals for **DREDGING** in MOBILE HARBOR, ALA.; BILOXI HARBOR, MISS, and PASCAGOULA RIVER, MISS., will be received at this office until 12 o'clock M., THURSDAY the 20th day of November, 1890, and opened immediately thereafter in presence of bidders. Specifications, general instructions to bidders, and blank forms of proposal will be furnished on application to this office. The attention of bidders is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. A. N. DAMRELL, Major of Engineers, U. S. A. 23

U. S. ENGINEER OFFICE, ROOM 62, ARMY Building, New York, October 15, 1890.—Sealed proposals, in triplicate, will be received at this office until 12 o'clock, noon, WEDNESDAY, November 19, 1890, for the following work: I. For the construction of new DIKES; II., for rebuilding and repairing existing dikes; III., for dredging in the Hudson River between New Baltimore and Troy, N Y. Amount available, $105,000. The attention of bidders is invited to Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large, and the River and Harbor Act of September 19, 1890, Sections 6 to 12. For specifications, blank forms, and all information, apply to the undersigned. G. L. GILLESPIE, Lieut.-Col. of Engineers. 24

OFFICE CONSTRUCTING QUARTERMASTER, Fort Thomas, Ky., October 27, 1890.—Sealed proposals, in triplicate, subject to usual conditions, will be received at office of Constructing Quartermaster, U. S. A., FORT THOMAS, KY., until 11 A. M., November 27, 1890, and then opened, for construction there, of a **HOSPITAL** and hospital steward's quarters, and for the steam heating apparatus for the hospital. and for the plumbing of each building. The United States reserves the right to reject any or all bids, or parts thereof. Plans and specifications to be seen at this office, with full instructions as to bidding. Envelopes containing proposals should be marked, "Proposals for Hospitals, etc.," and addressed to 1st Lieutenant R. B. TURNER, 6th Inf'try, A. A. Q. M., U.S.A.

U. S. ENGINEER OFFICE, 905½ EAST MAIN Street, Richmond, Va., October 13, 1890.—Proposals for **DREDGING** and excavating rock from the channel of the James River near RICHMOND, VA., for the construction of mattress dykes and jetties, will be received until noon of December 9, 1890, and then opened. Attention is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414. Statutes at Large. Information can be had on application to Mr. C. P. E. Burgwyn, 905½ E. Main Sreet, Richmond, Va. WM. P. CRAIGHILL, Colonel, Corps of Engineers, U. S. A. 23

PROPOSALS.

PROPOSALS FOR IMPROVING ENTRANCE to Galveston Harbor.—U. S. Engineer Office, Galveston, Tex., October 25, 1890.—Sealed proposals, in duplicate, will be received at this office, until 12 o'clock, noon, 90th Meridian time, December 27, 1890, and then opened for delivery of materials in place for improving the entrance to GALVESTON HARBOR, TEX. Preference will be given to materials of domestic production or manufacture, conditions of quality and price (import duties included) being equal. The attention of bidders is invited the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, U. S Statutes at Large. For blank forms, for proposals and all necessary information, apply to CHAS. J. ALLEN, Major, Corps of Engineers. 22-23-24

NOVEMBER 6, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 4th day of December, 1890, for all the **LABOR AND MATERIAL** required for the excavation, concrete foundations, stone and brickwork of the basement and area walls, first floor iron beams and girders and columns in basement, for the U. S. Court-House, Post-Office and Custom-House building at BAY CITY, MICHIGAN, in accordance with the drawings and specification, copies of which may be had at this office or the office of the Superintendent at Bay City, Mich. Each bid must be accompanied by a certified check for $200. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked "Proposal for the Excavation, Concrete Foundations, Stone and Brickwork and Ironwork for the Basement and Area Walls for the U. S. Court-House, Post-Office and Custom-House at Bay City, Mich.," and addressed to JAS. H. WINDRIM, Supervising Architect. 24

OCTOBER 25, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 20th day of November, 1890, for all the **LABOR AND MATERIALS** necessary to complete the approaches, mailing platform, post-office lookout, etc., for the U. S. Court-House and Post-Office building at PITTSBURG, PA., in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent. Each bid must be accompanied by a certified check for $300. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Approaches, Mailing Platform, Post-Office Lookout, etc., for the U. S. Court-House and Post-Office building at Pittsburg, Pa.," and addressed to JAS. H. WINDRIM, Supervising Architect. 23

OCTOBER 24, 1800.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 18th day of November, 1890, for all the labor and materials required for the **JOINERY WORK, WOOD FLOORING**, etc., for the U S. Court-House and Post-Office building at PITTSBURG, PA., in accordance with drawings and specification, copies of which may be had on application at this office or the office of the Superintendent. Each bid must be accompanied by a certified check for $500. The Department will reject all bids received after the time herein stated for the opening of the same; also, bids which do not comply strictly with all the requirements of this invitation. Each proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Joinery Work, Wood Flooring, etc, for the U. S. Court-House and Post-Office building at Pittsburg, Pa.," and addressed to JAS. H. WINDRIM, Supervising Architect. 23

OCTOBER 28, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M. on the 25th day of November, 1800, for all the **LABOR AND MATERIALS** required for the erection and completion of the U. S. Court House, Custom-House and Post-Office building at BROWNSVILLE, TEX., in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Brownsville, Tex. Each bid must be accompanied by a certified check for $500. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not strictly comply with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Erection and Completion of the U. S. Court-House, Custom-House, and Post-Office building at Brownsville, Tex." and addressed to JAS. H. WINDRIM, Supervising Architect. 23

DREDGING, Chicago, Ill.—Proposals are wanted until November 16, for doing dredging in Calumet River, Illinois and Indiana, and in Calumet Harbor, Ill. Address Captain W. L. Marshall, Corps of Engineers, U. S. A., as above.

DREDGING. New York City. — Proposals are wanted until November 19, for dredging and blasting Middle Ground, off Sunken Meadow, East River, N. Y. Address Lieut.-Col. G. L. Gillespie, U. S. A., as above.

DREDGING, New York City. — Proposals are wanted until November 21, for dredging in Newtown Creek, N. Y.; Gowanus Bay, N. Y.; and Raritan Bay, N. J. Address Lieut.-Col. G. L. Gillespie, U. S. A., as above.

PROPOSALS.

OCTOBER 25, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 19th day of November, 1890, for all the **LABOR AND MATERIALS** required to furnish and fix in place complete the low pressure, return circulation, steam heating and ventilating apparatus, and to complete the plumbing of the U. S. Court-House, Post-Office, etc., building at WINONA, MINN., in strict accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Winona Minn. Each bid must be accompanied by a certified check for $300. The Department will reject all bids received after the time herein fixed for opening the same; also, all bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked, "Proposal for Low-Pressure, Steam Heating and Ventilating Apparatus, and for completion of the Plumbing of the U. S. Court-House, Post-Office, etc., building at Winona, Minn," and addressed to JAS. H. WINDRIM, Supervising Architect. 23

NOVEMBER 5, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M. on the 3d day of December, 1890, for furnishing all **LABOR AND MATERIALS** required for the erection and completion (except heating apparatus and approaches), of the U. S. Court-House and Post-Office building at HELENA, ARKANSAS, in accordance with the drawings and specification, copies of which may be had on application to this office or at the office of the Superintendent at Helena, Arkansas. Each bid must be accompanied by a certified check for $500. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Erection and Completion of the U. S. Court-House and Post-Office building at Helena, Arkansas," and addressed to JAS. H WINDRIM, Supervising Architect. 24

ROAD WORK, Stapleton, S. I.—Proposals are wanted until November 17, for macadamizing, grading, etc., certain roads in Richmond County. Address Charles M. Todd, Clerk pro tem, Tompkinsville, S. I.

BREAKWATER, New York City.—Proposals are wanted until December 2, for the construction of a breakwater at New Haven, Conn. Address Col. D. C. Houston, U. S. A., as above.

POST-OFFICE, Ottawa, Ont. — Proposals are wanted until November 18, for the erection of a post-office at Carleton Place, Ont. Address A. Gobiel, Secretary Board of Public Works, as above.

HARBOR IMPROVEMENTS, Chicago, Ill.—Proposals are wanted until November 19, for dredging in the Calumet River and Harbor. Address Captain W. L. Marshall, Corps of Engineers, U. S. A., as above.

PIPE, Topeka, Kan.—Proposals are wanted until November 10, for furnishing a quantity of cast-iron pipe. Address George H. Pearson, Consulting Engineer, as above.

SEWERS, Suspension Bridge, N. Y.—Proposals are wanted until November 18, for the construction of certain sewers. Address Leander Scott, President Board of Sewer Commissioners, as above.

BROKEN STONE, New York City.—Proposals are wanted until December 1, for furnishing 41,000 cubic yards of broken stone and 62,000 barrels of Rosendale cement. Address Lieut.-Col. G. L. Gillespie, U. S. A., as above.

METAL WORK, San Francisco, Cal.—Proposals are wanted until December 4, for furnishing the materials, labor, etc., of the metal work for the Northwest Seal Rock Light Station, California Address Major W. H. Heuer, U. S A., as above.

WATER-WORKS, Ballinger, Tex.—Proposals are wanted until January 1, 1891, for the construction of a system of water-works. Address Mayor B. S. Taylor, as above.

BRIDGE, Sheboygan, Wis.—Proposals are wanted, no date specified, for furnishing specifications for a swing iron bridge. Address C. V. Boley, City Engineer, as above.

BRIDGES, Hamilton County, O.—Proposals are wanted until November 22, for the construction of three iron bridges. Address the Board of County Commissioners, as above.

BRIDGE APPROACHES, Roanoke, Va.—Proposals are wanted until November 14, for the erection of the approaches to the bridges at Randolph, Henry and Park Streets. Address the Committee on Bridges, as above.

WATER-WORKS, Harrison, O.—Proposals are wanted until November 24, for the construction of a system of water-works at this place. Address Mayor J. A. Graft, as above.

RIPRAP STONE, Charleston, S. C.—Proposals are wanted until November 18, for furnishing about 50,000 tons of riprap stone on the South Jetty, at this place Address Captain Frederic V. Abbot, U. S. A., as above.

DREDGING, Charleston, S. C.—Proposals are wanted until November 21, for dredging in Wappo Cut, S. C., Brickyard Creek, S. C., and between Estherville and Minim Creek, S. C. Address Captain Frederic V. Abbot, U. S. A., as above.

LIGHTING, Jersey City, N. J.—Proposals are wanted until December 1, for lighting the public streets of this place for one year from December 1. Address G. F. Robinson, Clerk of the Board of Police Commissioners, as above.

DREDGING, Charleston, S. C.—Proposals are wanted until November 20, for dredging about 40,000 cubic yards of material at this place. Address Captain Frederic V. Abbot, U. S. A., as above.

THE ENGINEERING & BUILDING RECORD
AND
THE SANITARY ENGINEER.

A JOURNAL FOR THE ENGINEER, ARCHITECT, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1890, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 22. NUMBER 24.
PUBLISHED EVERY SATURDAY. 277 PEARL ST., NEW YORK.
NEW YORK, NOVEMBER 15, 1890.
LONDON, NOVEMBER 29, 1890.
SINGLE COPIES, TEN CENTS. Subscription, $4.00 per year in advance, post paid. IN AMERICA
Subscription, 25s. per annum in advance, post paid. IN GREAT BRITAIN.

THE ENGINEERING & BUILDING RECORD, *conducted by* HENRY C. MEYER, *is published every Saturday at* 277 *Pearl Street, New York* (*P. O. Box* 3037). *Its opinions upon all technical subjects are either prepared or revised by specialists.*

OFFICE IN GREAT BRITAIN,
92 & 93 FLEET ST., LONDON.

PHILADELPHIA OFFICE 1050 DREXEL BUILDING.

TERMS, $4 PER YEAR, IN ADVANCE.
25s. in GREAT BRITAIN. Other Foreign Countries $6.
Postage Paid.

SPECIAL OFFERS.

DOUBTLESS many of our subscribers have a friend or friends who think of subscribing to THE ENGINEERING AND BUILDING RECORD for the coming year, and as every paper, however successful it may be, desires to increase the number of its subscribers, the following offers are made, to hold good during October, November and December, 1890:

Any present subscriber can have his subscription extended one year by sending:

One Renewal and One New Subscription..$7.25
" " " Two " " ..10.00
" " " Three " " ..13.00
" " " Four " " ..16.00

The new subscribers will receive, free of charge, the remaining issues of 1890, that is, those which appear after the order is received.

THE ENGINEERING AND BUILDING RECORD,
P. O. Box 3037. 277 Pearl Street, New York.

RIGID SPECIFICATIONS.

WHILE the necessity of having specifications for any contract work sufficiently rigid to insure proper construction is too evident to need argument, it is not infrequently the case that an engineer requires too much in them, more, in fact, than it is possible to enforce.

This overloading with unnecessary requirements may come from an honest but mistaken idea that good work can only be secured by minutely detailed and excessively rigid specifications, and the engineer tries from his experience to meet every possible contingency by a series of cast-iron clauses. Again, an inexperienced engineer, or one having little experience in the particular line of work covered by the specifications, may borrow them from others without appreciating that many of the conditions do not properly apply to the work he has in hand. It also may be said that, while it is quite necessary to leave to the absolute decision of the engineer a certain share of disputes that may arise, classification of work, payment for extra work, etc., it is undesirable to give him any more of such absolute power than is avoidable—undesirable for the engineer as well as for the contractor

Such rigid specifications are, primarily, unfair to the contractor. To insure good work he should have a living profit, and should not be compelled to lose the whole of it, and even more, by finical requirements and objections that really add nothing to the quality of the work. It may be said, it is true, that the contractor has the specifications to bid from, and makes his bid with his eyes open; but if all the bidders made up their estimates with the intention of endeavoring to carry out honestly all the conditions of such specifications, and running the risk of losses from the crotchets of the engineer, the cost of the work might be quite unnecessarily increased, and probably the engineer's estimate exceeded. What really happens is that the bidders discount their chances to evade these rigid clauses, and any man putting in a bid, with the intention of endeavoring to fulfill them to the letter, would have no chance whatever in the competition. Reputable contractors, in such cases, frequently refuse to bid, and the coast is left clear for the irresponsible men who gamble on their chances of evading everything undesirable in the specifications, and who intend to make money out of their work at any cost. If the engineer allows these rigid and unnecessary clauses to become a dead letter, he destroys the force of the whole instrument, and it becomes difficult for him to draw the line and enforce the legitimate conditions. If he attempt a strict enforcement, there are too many contractors that will take any measures to avoid losing money, and perhaps try to justify themselves with the fact that these rigid clauses in specifications are generally evaded, or are dead letters; in fact, they would consider themselves very harshly treated if the engineer attempted to compel them to conform to them.

The engineer or his assistant cannot be upon the ground constantly. He may have plenty of inspectors, but their pay is moderate, and they may be venal. It is much cheaper for the contractor to double or treble their pay to wink at violations of the specifications than to conform to them. In masonry, especially, it is frequently very easy to conceal bad work, at least for the time. The recent bad work in the masonry of the Washington Aqueduct and Croton Aqueduct tunnels is a familiar and somewhat trite illustration of this fact, although it is not claimed that in these instances the fault lies at all with the specifications.

Make the specifications plain and clear, but do not encumber them with what it is evident will be difficult or impossible to enforce. Respect the rights of the contractor as well as those of the owner, and do not treat him as an enemy to be thwarted, unless he shows an intention to cheat and skimp the work. Finally, *insist* that the specifications be carried out to the letter.

ACCURATE CITY SURVEYS.

THE necessity of obtaining accurate surveys and maps of large cities, and even for those of moderate size, is one of great importance, increasing with their growth in population and valuation of property.

With accurately determined and properly located reference points and a well constructed map, street and property lines can be definitely re-located at any time and in any contingency, lines of new streets can be readily established, questions of drainage and sewerage more easily studied, and any of the numerous municipal problems, constantly arising, more satisfactorily solved. And with a system of carefully checked standard bench marks the work of the engineer is greatly diminished, as well as made more reliable in all city improvements, private as well as public, and the work of the different engineering departments of the city harmonized. In one city, at least, the different departments of city works have not only their own set of bench marks, but even different datum planes, a source of endless confusion.

The report of the Sewer Commissioner of St. Louis, Robert E. McMath, M. Am. Soc. C. E., noticed in another column, shows that there, at least, they are fully alive to the advantages accruing from accurate work of this description. A thoroughly conceived official survey of the city is now in progress, using as a base line one of the triangulation lines of the United States Coast and Geodetic Survey, and from this covering the city with a series of triangles. In this way the absolute geographical position of all the points of the city triangulation, and the true azimuths of the connecting lines are determined and recorded for public use. In connection with this survey, levels of precision are run and numerous bench marks established, which will become standard benches for all classes of city work. A list of the bench marks, as far as determined, giving a detailed description of their location and their elevation above the city directrix, is appended to the report, making them readily available for private as well as public work. For topography, stadia measurements are taken and elevations obtained by vertical angles.

In the triangulation, transits reading to 5 or 10 seconds are used, and, where possible, all angles of each triangle are measured. Four double sets of angles, positive and negative, and with the telescope both direct and reversed are taken by repetition, equivalent to 40 single measurements of each angle. The average closure of the triangles has been a little over 4 seconds; the discrepancy in length of sides from 1 in 80,000 to 1 in 180,000. In addition to determining the geodetic latitudes and longitudes of each point, its co-ordinates from the intersection of the nearest minute lines of latitude and longitude are also computed. For the levels, which are duplicated in opposite directions, the limit of error of closure has been taken at $0.0208\sqrt{D}$ (D being the distance in miles). Any levels giving an error exceeding this are repeated. The average closure per mile has been 0.013 feet. In the stadia work the computations, as far as carried, indicate a closure as good as one in 800.

Similar methods of survey have been pursued in some other cities, and it is to be hoped that such accurate work, and especially the connection of the surveys with those of the United States Coast and Geodetic Survey where possible, will become more general.

BRIDGE BUILDING OVER NAVIGABLE WATERS.

Projectors of bridges over navigable waters are in trouble.

It is thought that a recent act of Congress will seriously interfere with bridges now being constructed.

The Act may also compel the modifications of plans of bridges to be built in the future. This Act was adopted in September last. In substance, it gives the Secretary of War the power to require the removal of any bridge, no matter under what charter built, which may be deemed an obstruction to navigation; and that no bridge shall be started or erected in any navigable stream unless the plans are first submitted to and approved by the Secretary of War.

The river men at Pittsburg, recently took steps to object to bridges now under course of construction across the Monongahela and Ohio Rivers. They claim that the bridge of the McKeesport and Bessemer road and the wagon bridge projected at McKeesport do and will obstruct navigation, and the Secretary of War will be asked to so decide and order a change of plans. The bridge at Ceredo over the Ohio River will also be the subject of similar complaint.

It is held by the river men that under this act no false work or piling or any substance can be erected in the channel of a navigable stream to support portions of a bridge under construction, and that therefore all new bridges must be either of the cantilever type or built under some other plan which offers no obstruction.

NOTES.

The University of Wisconsin, at Madison, began work this year with 1,000 students enrolled. The facilities for the prosecution of scientific studies are said to be excellent, and the instruction furnished of a high class.

At the meeting of the Boston Society of Civil Engineers to be held on November 19, 1890, the subject of "Roads and Road Making" will be taken up for general discussion by the members. The discussion will be opened by a paper by Prof. C. F. Allen, and Messrs. E. W. Howe, W. E. McClintock, A. F. Noyes, and others, have signified their intention of taking part in the discussion.

The work of constructing a new water-power canal on the Canadian side at Sault Ste. Marie, Ont., with Lake Superior as a reservoir, has been commenced. The necessary permission was recently obtained from the Dominion Government. Local capitalists, assisted by the city corporation, have undertaken the project. The canal is to be half a mile long, 12 feet deep and 50 feet wide, and will afford water-power for manufacturing purposes.

The corner stone of the Masonic Temple, at Chicago. Ill., was laid on the 6th inst. The building will probably be the greatest Masonic structure in the world.

The final competition of plans for the new building to be erected by the American Fine Arts Society at New York will take place to-day. Three competitors won premiums at the original competition. They were H. J. Hardenbergh, Edmund B. Wells, and Babb, Cook & Willard. The three were directed to submit new plans, to be handed in to-day. These plans are now complete, and the society will consider them in private and announce the final result at the opening of the annual exhibition in December.

MEETINGS OF ENGINEERING SOCIETIES.

The American Society of Civil Engineers holds its regular meetings on the first and third Wednesday in each month, at the House of the Society, 127 East Twenty-third Street, New York.

The Boston Society of Civil Engineers holds its regular meetings at the American House, Boston, at 7.30 P. M., on the third Wednesday in each month.

The Western Society of Engineers holds its regular meetings at No. 78 La Salle Street, Chicago. at 7.30 P. M., on the first Wednesday in each month.

The Engineers' Club of St. Louis holds regular meetings in the club's room, Laclede Building, corner Fourth and Olive Streets, St. Louis, on the first and third Wednesdays in each month.

The Engineers' Club of Philadelphia holds regular meetings at the House of the Club, 1122 Girard Street, Philadelphia.

The Engineers' Society of Western Pennsylvania holds regular meetings on the third Tuesday in each month, at 7.30 P. M., at its rooms in the Penn Building, Pittsburg, Pa.

The Engineers' Club of Cincinnati holds its regular meetings at 8 P. M. on the third Thursday of each month at the Club rooms, No. 24 West Fourth Street, Cincinnati.

The Civil Engineers' Club of Cleveland holds regular meetings on the second Tuesday of each month, at 8 P. M., in the Case Library Building, Cleveland Semi-monthly meetings are held on the fourth Tuesday of the month.

The Engineers' Club of Kansas City meets in Room 200, Baird Building, Kansas City, Mo., on the second Monday in each month.

The Engineering Association of the Southwest holds regular meetings on the second Thursday evening of each month at 8 o'clock, at the Association headquarters, Nos. 63 and 64 Baxter Court, Nashville, Tenn.

The Civil Engineers' Society of St. Paul meets at St. Paul, Minn., on the first Monday in each month.

The Montana Society of Civil Engineers meets at Helena Mont , at 7.30 P. M., on the third Saturday in each month.

The Civil Engineers' Association of Kansas holds regular meetings on the first Wednesday in each month at Wichita, Kan.

The New England Water Works Association holds quarterly meetings in Boston at Young's Hotel.

The Canadian Society of Civil Engineers holds its regular meetings on each alternate Thursday, commencing with the 9th of October, at the House of the Society, 112 Mansfield Street, Montreal.

The Engineering Department of the Brooklyn Institute, Brooklyn, holds regular meetings, at 8 P. M., on the third Tuesday of each month. Until the Institute building is repaired, the meetings will be held in the rooms of the Young Men's Christian Association Building, 502 Fulton Street.

OBITUARY.

James Gregory, a well-known brass and copper founder and finisher, of New York, died on the 6th inst.

Prof. Milton B. Goff, Chancellor of the Western University, died on the 8th inst., at Allegheny, Pa. During the visit of the British Iron and Steel Institute last month the Chancellor broke a leg by a fall at Homestead. Pneumonia developed itself afterward, and his death was looked upon as a certainty some days ago. Professor Goff was born in Allegheny City, December 17, 1831.

PERSONAL.

J. B. Norris has resigned his place as Superintendent of Water-Works at Huntington, W. Va.

H. J. Stanley, formerly Chief Engineer for Cincinnati, has been reappointed by the new Cincinnati Board of Affairs, vice, J. C. Stewart, removed.

Andrew Rosewater, formerly City Engineer of Omaha, Neb., has been selected by President Harrison to be a member of the Electrical Board in the District of Columbia.

Charles H. Leddie, M. Am. Soc. C. E., residing at St. Louis, Mo., was recently elected Vice-President and General Manager of the Greenville Water and Electric Light Company, of Greenville, Tex.

The President of Mexico has appointed Señor Don Leandre Fernandez to represent the Government of Mexico in the International Railway Commission. Señor Fernandez is an eminent civil engineer of that country.

Chief Engineer George R. Johnson, U. S. N., having reached the age of retirement, 62 years, will be succeeded as inspector of machinery on Government work at the Columbian Iron Works, by Chief Engineer George W. Roche, who is at present a member of the Naval Board to test coil boilers.

ENGINEERING SOCIETIES.

A meeting of the Western Society of Engineers was held on November 5, at their quarters, 78 La Salle Street, Chicago. President E. Cooley in the chair, John W. Weston, secretary, and about 50 other members attending. Three applications for membership were received.

The Society formally indorsed the course of its representatives, O. Chanute, D. J. Whittemore, E. L. Corthell and C. L. Strobel, who attended the convention of local societies of United States and Canada, in Chicago, on October 14 and 15, at which it was decided to hold at Chicago, during the World's Fair, an international engineering congress. In this convention a letter was read from F. R. Hutton, New York, Secretary of the American Society of Mechanical Engineers, saying he would have the circular report regarding the congress "presented to our council at a meeting just in advance of the Richmond convention, opening November 11," and would submit the same to the society at large."

Other similar indorsements were read, and the chair said that congratulations seemed in order, that practical steps were being taken to secure a successful world's congress of engineers, and he took under advisement the appointment of three gentlemen to represent this society, as also a local standing advisory committee of three, as recommended by the committee.

Messrs. Lundy, Alexander and Carner were appointed a committee on the annual entertainment, and Messrs. Corthell, Gottlieb and Artingstall, former presidents of the Society, a committee to nominate officers to the December meeting.

Then a paper was read by Mr. L. P. Morehouse on "The State *vs.* the Railroads." He said that with the progress of socialism there will be an increased willingness to allow the Federal Government to assume powers not exercised before. One acquisition by the Government will be the telegraph system, and another, the railroad system of the country. The solution of the railroad problem was imperative in the interest of the people. The time was passed when the idea could be maintained that the railroads could conduct their business independently of the State. Created by the State, they could be regulated in every respect by their creator, and it was reasonable that the public should be protected from what must be always, more or less, a monopoly.

At a meeting of the Engineers' Club, of Philadelphia, held on November 1, 1890, the Secretary presented a report from the committee which had been appointed to represent the club at the convention of representatives of the engineering societies, held in Chicago, with reference to the part the engineers of this country should take in the coming World's Fair in Chicago. This committee consists of President H. W. Spangler, Chairman, and Messrs. Wilfred Lewis and E. V. d'Invilliers.

It was decided that the club would contribute $500, and that members be invited to each send a contribution of not less than $1 to this fund.

Mr. Benjamin Franklin presented a paper upon "The Application of Drain Tiling to the Improvement of Ground for Residences."

There was some discussion of this paper. Mr. Howard Hurphy noted a case where drain tiling had been used by him around a private residence in order to relieve the flooding and dampness in the cellar.

The Secretary presented, for Mr. Harvey Linton, a paper upon "Topographic Surveying," with photographic illustrations. The Secretary presented, also, the resignations from active membership of Messrs. Wm. H. Burr, Wm. O. Dunbar and Edward I. H. Howell.

According to the London *Builder*, the foundation stone of the great tower to be erected at Douglas, Isle of Man, was laid on October 21 by the Earl of Lathom. The tower is to comprise six floors, to be used severally as a theatre, dancing saloon, concert hall, bazaar, shops, and the topmost has an observatory. The tower will be as high as St. Paul's Cathedral, the estimated cost is about $400,000, and it is expected that it will be completed by the midsummer of 1892.

W. H. Sayward, of Boston, Secretary of the National Builders' Exchange, made an address in Minneapolis, Minn., before the members of the Building Exchange. Mr. Sayward dwelt on the advantages of builders' exchanges, and the necessity of organizing for the protection of rights, and of working together in harmony.

THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

RICHMOND, VA., MEETING.

(From a Staff Correspondent.)

ABOUT a hundred members and guests of the American Society of Mechanical Engineers left New York by special train on Monday evening, November 10, and arrived at Richmond on the following morning.

After establishing themselves at headquarters many of them inspected the electric street car system, the tobacco manufactories, and other industrial plants. In the afternoon the first session was opened. About 150 members and ladies were present and were welcomed by Hon. J. Taylor Ellyson, Mayor of Richmond, who briefly referred to the social and political history of the city, its progress and accumulation of wealth during the last 25 years, and to its present mechanical and manufacturing prospects. He predicted, as the result of the convention, a stimulus in the direction needed. President Oberlin Smith replied, thanking him and the people of Richmond for their welcome, and then presented his official address, the subject of which was, "The Engineer as a Scholar and a Gentleman."

"Assuming," said Mr. Smith, "that the great majority of the men who are styled and who style themselves 'engineers' are really worthy of the title—that in some one or more of the numerous departments of their calling they know how to get the better of Dame Nature, so to speak, by designing and constructing a good road, or bridge, or railway, or canal; by locating and digging a good mine, and knowing what comes out of it; by planning and building a good machine, without the scrap-heap's credit entry showing more avoirdupois than the bill of lading; by taming the lightning as a gentle beast of burden in its modern harness of copper and silk and iron; by creating beautiful buildings not of the order of the ephemera, the following questions arise:

"Does this aggregate mass of engineers attain to as high a professional standard as, all things considered, our modern civilization would lead us to expect? Does this body of men, who, without question, are of vastly more importance to the world than those of any other one profession or trade, stand as high in the estimation of their fellow-men as their important position would seem to demand? and is their craft (one which, if properly practiced, requires as much learning as do the crafts of law or medicine) thoroughly recognized as one of the learned professions? The answer is an unqualified affirmative."

Mr. Smith, speaking further, pointed to what he considered the proper course of education to be pursued in preparation for engineering studies.

In the evening the members and guests were received at the Gubernatorial Mansion by his excellency, Governor Phillip McKinney and his wife, assisted by Col. W. Miles Carey of his staff, and many Richmond ladies and gentlemen, and by the local committee.

WEDNESDAY MORNING.

The first business was the reading of the general report of the Council. This was followed by the report of the Finance Committee, which showed that the receipts were $17,720.40; disbursements, $17,673.37; balance, $37.13; amount to the credit of the library fund, $2,163.48.

The committees on "Uniformity of Flange Diameters" and "Methods of Tests of Materials" reported progress. The committee on the "Methods of Test of Locomotive Efficiencies" made no report. The committee on "Methods of Duty Trials of Pumping Engines" reported through its chairman, who summarized the main features of the report presented last May, recommending the duty determination by measurement of heat units, the separation of boiler from engine duty, and the consideration of plunger displacement.

Discussion followed by George H. Barrus, Albert W. Jacobi, F. M. Wheeler, W. M. Barr, John T. Hawkins and James E. Denton, who approved of the use of thermal units, separation of pump and boiler and engine duties, and the use of the pump itself for its own meter. They also believed that some slight differences, not now accounted for, might be met in the action of a pump under special conditions of feed-water, that temperature was of great importance, and that a stroke indicator might be necessary, An instance of slip was mentioned where a pump delivered 7 per cent. more than its displacement. It was also thought better not to shorten the length of tests on account of the conditions of the fire.

The secretary read the report of the committee from the American Society of Mechanical Engineers who attended a joint meeting in Chicago, October 14, of delegates from the various engineering societies, which was held for the purpose of considering the feasibility of establishing headquarters at Chicago during the Columbian Exposition for their own members and for the entertainment of foreign visitors. The report recommended the establishment of headquarters at Chicago, and also recommended the holding of an International Congress of Engineers during the Exposition, to be in session six days, the proceedings to be conducted in English.

It was recommended to employ a secretary and two assistant, linguists, at the headquarters, chiefly to give information to engineers and introduce foreign visitors. The total expense was estimated at $10,000, to be met by a tax of $2 on each of the members of the societies, and by subscriptions. It was recommended that the Western Society have three delegates; the Civil, Mechanical, Mining, Electrical and Canadian Societies each two delegates, and the local societies each one delegate, and that all the societies take definite action within two months. The report was referred to the council. A communication from H. L. Binnsse was read, suggesting the compilation of an engineers' handbook by a committee of experts, and giving topical divisions similar to a recent German publication. The matter was laid on the table. Members were requested to interest Congressmen in behalf of an Ericsson memorial.

The following officers were elected for the ensuing year: President, Robert W. Hunt, of Chicago, Ill. Vice-Presidents, Stephen W. Baldwin, New York City; John F. Pankhurst, Cleveland, O.; Alexander Gordon, Hamilton, O. Managers, Andrew Fletcher, New York City; W. R. Warner, Cleveland, O.; Colman Sellers, Jr., Philadelphia, Pa. Managers holding over, J. E. Denton, C. W. Nason and H. H. Westinghouse. Treasurer, William H. Wiley, New York City.

Notice was given of a proposed amendment to Article 31 of the Rules, to provide for the nomination of at least two candidates for election for each office. Papers were presented as follows: By Frank Van Vleck on "Light Cable Road Construction;" by R. H. Thurston on "Authorities on the Steam Jacket: Facts and Current Opinions;" and by W. H. Adams on "An Engineering Problem at Richmond, Va.," the latter being a consideration of the available water power there, estimated at over 40,000 horse power.

The engineers were invited to inspect the Burton Electric Heater for warming street cars, and adjournment was followed by an excursion down the James River. Luncheon was served on the boat, and the party was received by Commander J. D. Graham, U. S. N., who extended to them the courtesies of the U. S. monitors Manhattan, Mahopac, Lehigh, Canonicus, Catskill, Ajax, and Wyandotte. These were inspected under the guidance of the staff officers.

On Wednesday evening papers were read on "Chimney Draft: Facts and Theories," by R. H. Thurston; "A Novel Form of Flexible Tubing," by T. R. Almond; "Heat Transmission Through Cast-iron Plates Pickled in Nitric Acid," by R. C. Carpenter; "Some Properties of Ammonia; Mechanical and Physical Properties of Sulphur Dioxide, and Theoretical Investigations of Efficiency of Vapor Engines," by D. V. Wood; "Experimental Determination of the Latent Heat of Ammonia," by D. S. Jacobus; and "The Automatic Regulation of Injection Water to Vapor Condensers," by J. McBride. These papers and the topical question, "Is there any reason why corrosion should be more active in one place rather than another inside a steam drum properly piped to connect several boilers in a battery?" were discussed by Messrs. Denton, Smith, Barratt, Nason, Grimm, Sterling, Barr, Hawkins, Davis, Wheeler, McElroy and Britton.

Thursday morning papers were read on "Hydraulic Hoisting Plant for the Pier of Brooklyn Sugar Refining Company," by L. G. Engel; "Hydraulic Traveling Cranes," by E. Graves; "The Single-Acting Compound Engine," by W. A. Bole; "Rope Driving," by C. W. Hunt; "Accident-Preventing Devices for Machines," by J. H. Cooper; "New Process for Generating and Cutting the Teeth of Spur Wheels," by A. Swasey; "An Interesting Experiment with a Lubricant," by G. W. Bissel; "Performance of a 75-Ton Refrigerating Machine of Ammonia Compression Type," and "Some Special Experiments with a Lubricant," by J. E. Denton. Written and oral discussions were presented by Messrs. Sweet, Ball, Webber, Miller, Smith, McBride, Hawkins, Denton, Hunt, Campbell, Tompkins, Thurston, Nason and Woolson.

Resolutions of thanks were passed for the hospitality and attentions received from the Governor, Mayor, citizens, railroads, and numerous firms and individuals and corporations who entertained the society.

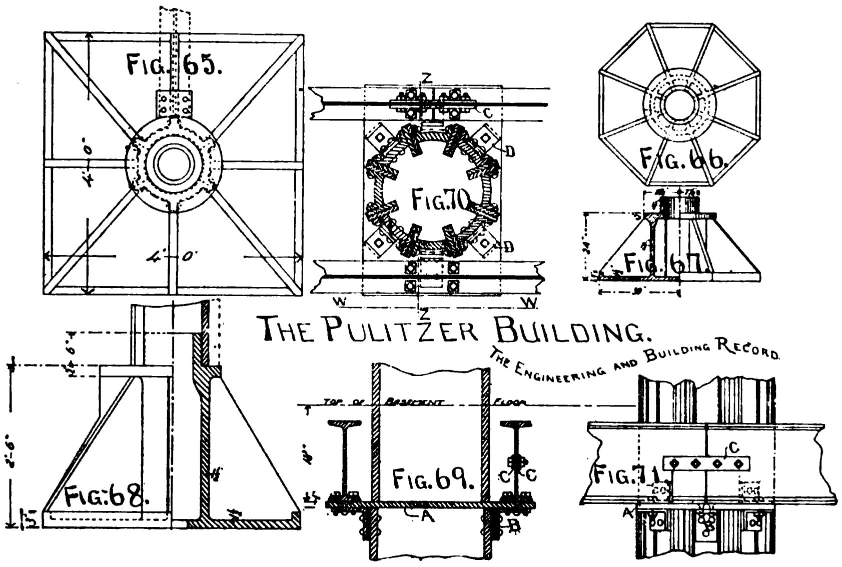
Thursday afternoon the members and guests were taken in carriages to the Tredegar Iron Works, where luncheon was served. Thence they visited the Richmond Locomotive Works, the Lee Monument, Hollywood Cemetery, and various points of local interest.

Thursday evening a reception, ball and supper were given by the ladies and gentlemen of Richmond, and on Friday the party went by special train to the yards of the Newport News Ship Building Company; to the Portsmouth Navy Yard, visiting the new United States battle ship "Texas" and the cruisers, and to Norfolk and to Old Point Comfort, where some of the party remained to attend the ball given them, and the remainder returned home, via Richmond and other points.

The following members and guests were registered as in attendance at the meeting:

Alberger, Louis R., with H. R. Worthington, New York City; Allison, Robert, and wife, Franklin Iron Works, Port Carbon, Pa.; Albree, Chester B., Pittsburg, Pa.; Archer, E. R., Richmond, Va.; Adams, W. H., New York; Ashworth, Daniel, Pittsburg, Pa.; Babbitt, George Rodney, and wife, Providence, R. I.; Ball, Frank H., and wife, Erie, Pa.; Bang, Henry A., New York; Barr, William M., Germantown Junction, Philadelphia, Pa.; Barrus, George H., Boston, Mass.; Bennett, F. M., Washington, D. C.; Beach, C. S., Bennington, Vt.; Bond, Geo. M., Hartford, Conn.; Britton, J. W., Cleveland, O.; Brooks, Wm. B., Richmond, Va.; Bulkley, H. W., New York; Campbell, Geo. W., Newark, N. J.; Burr, S. D. V., New York; Carr, C. A., U. S. N., Washington, D. C.; Coleman, J. B., Elmira, N. Y.; Cooper, J. H. and wife, Philadelphia; Cullingworth, Geo. R., New York; Dallett, W. P., Philadelphia; Davis, E. F. C., Richmond, Va.; Denton, J. E., Jersey City, N. J.; Doran, W. S. New York; Engel, L. G., Brooklyn, N. Y.; Eberhart, F. L. H. and sister, Newark, N. J.; Fairbank, Sidney, Winchendon, Mass.; Frost, G. H., New York; Fitts, J. H.; Fladd, F. C. and wife, New York; Foster, W. A., Corning, N. Y.; Foster, C. E., Washington, D. C.; Gantt, H. L., Philadelphia; Gobeille, J. L., Cleveland, O.; Gentry, T. W., Richmond, Va.; Gray, G. A., Cincinnati; Grimm, P. H., Glen Cove, N. Y.; Hand, S. A., Philadelphia; Greenwood, P. F., Richmond; Hawkins, J. T., Taunton, Mass.; Hemenway, F. F., New York City; Henderson, Alexander, Chief Engineer U. S. N., Navy Yard, Boston, Mass.; Henderson, G. R., Roanoke, Va.; Hillard, Charles J., Pittsburg, Pa.; Holland, John, Dover, N. H.; Holloway, J. F., New York City; Hunt, Charles Wallace, New York City; Hutton, Frederic R., New York City; Hyde, Charles E., Bath, Me.; Jacobi, Albert W., New York City; Jacobus, D. S., Hoboken, N. J.; Husted, Chas. L., Coatsville, Pa.; Jewett, L. C., Erie, Pa.; Laforge, Frederick Henry, Waterbury, Conn.; Laird, John A., St. Louis, Mo.; Lane, Harry M., Cincinnati, O.; Leonard, I. H., U. S. N., Washington, D. C.; Lowe, F. R., New York; McBride, James, Brooklyn, N. Y.; McElroy, Samuel, Brooklyn, N. Y.; MacFarland, Walter M., U. S. N., Washington, D. C.; Mattes, William F., West Superior, Wis.; Mellin, Carl J., Richmond, Va.; Mirkil, Thomas H., Jr., Philadelphia, Pa.; Moore, D. G., Elizabeth, N. J.; Mumford, E. H., Detroit, Mich.; Nason, Carlton W., New York City; Parks, Edward H., Providence, R. I.; Passel, George W., Cincinnati, O.; Painter, Wm., Baltimore, Md.; Pope, Ralph W., Elizabeth, N. J.; Phillips, C. Von, Bethlehem, Pa.; Pickrill, J. M., Richmond, Va.; Rogers, Winfield S., Troy, N. Y.; Rood, Vernon H., Jeanesville, Pa.; Redwood, Lloyd J., Brooklyn, N. Y.; Ross, D. L., Indian Orchard, Mass.; Shirrell, David, Richmond, Va.; Smith, George H., Providence, R. I.; Skinner, F. W., ENGINEERING AND BUILDING RECORD, New York; Smith, Jesse M., Detroit, Mich.; Smith, Oberlin, Bridgeton, N. J.; Smith, Scott A., Providence, R. I.; Snell, Henry I., Philadelphia, Pa.; Spaulding, H. C., Boston, Mass.; Sperry, Charles, Port Washington, N. Y.; Stillman, Francis Hill, Brooklyn, N. Y.; Stirling, Allan, New York City; Swasey, Ambrose, Cleveland, O.; Thompson, John, New York; Tompkins, S., Charlottesville, Va.; Torrey, Herbert Gray, Sterling, N. J.; Tucker, W. B., Elizabeth, N. J.; Webster, John H., Boston, Mass.; Wellman, Samuel T., Cleveland, O.; Wheeler, F. Meriam, New York; Whitehead, George E., Providence, R. I.; Whitney, Baxter D., Winchendon, Mass.; Wilcox, John F., Pittsburg, Pa.; Wiley, Wm. H., New York City; Whitney, Wm. M., Winchendon, Mass.; Woolson, Orosco C., Newark, N. J.; Wolcott, Frank P., Carteret, N. J.; Lipps, H. Jr., Raleigh; Vanderbilt, A., New York; Wood, W. H., Philadelphia, Pa.; Phillips, G. H., Newark, N. J.; Almond, T. R. and wife, New York; Parker, C. D., Worcester; Hemenway, F. F. New York; Wightman, D. A., Pittsburg; Bray, C. W., Youngstown; Hand, F. L., Philadelphia; Dick, J., Meadville, Pa.; Reiss, J. T., Hamilton, O.; Graves, E., Camden, N. J.; Kinney, R. C., Hamilton, O.; Raynal, A. H. and wife, Richmond; Field, C. J., New York; White, W. Jr., Pittsburg; Jones, W. C., Cincinnati; Simpkins, Wm. and wife, Richmond; Roberts, Wm., Waltham, Mass; Delaney, A., Richmond; Ogden, J. L., Philadelphia; Barnes, A. T., Boston; Comly, G. M., Edgemoor, Del.; Shepherd, W. J., Chester, Pa.

BARREN ISLAND odors are at present the subject of an investigation by the New York State Board of Health, a movement having been started to have the horse and fish rendering establishments removed from that place.



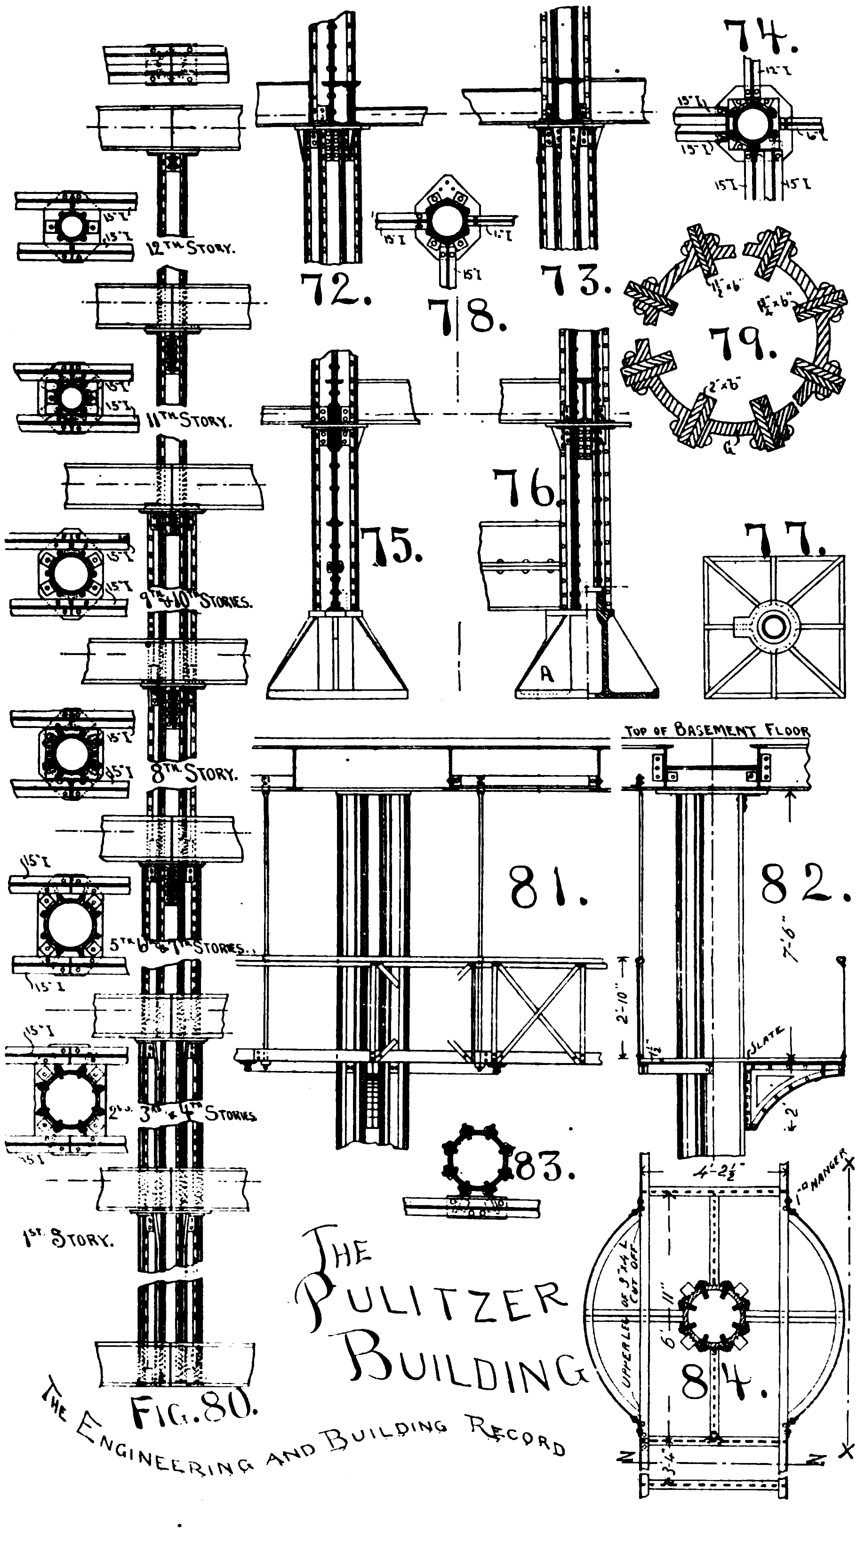
THE NEW YORK WORLD BUILDING.

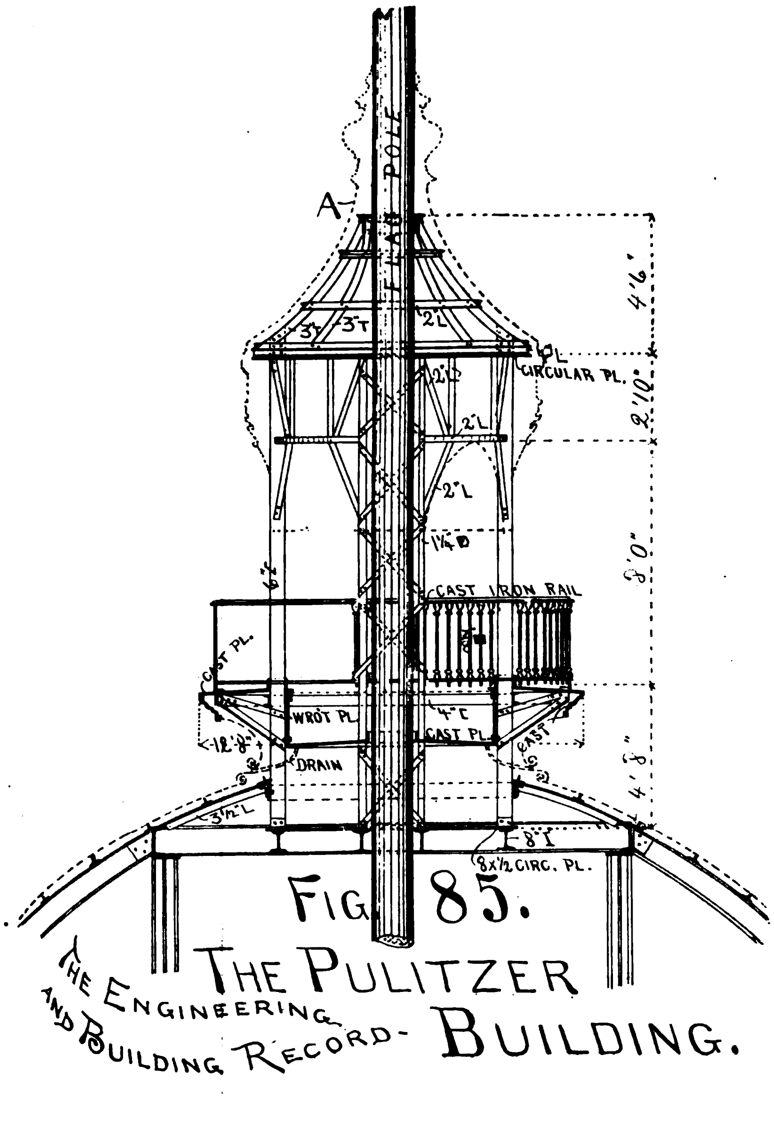
PART. III.—BEAM PLANS AND DETAILS OF COLUMNS; LANTERN, AND GENERAL IRON CONSTRUCTION.*

FIGURE 54 is a diagram of the third tier or first floor beam arrangement. The different sizes are indicated by letters as follows: A, 7-inch 15lb. I-beam; B, 15-inch 41lb. I-beam; C, 15-inch 80lb. I-beam: D. 12-inch 40lb. I-beam; E, 15-inch 50 lb. I-beam; F, 9-inch 27lb. I-beam; G, 12-inch 32lb. I-beam; H, 6-inch 13lb. and 15lb. I-beam; I, 8-inch 18lb. I-beam; J, 10-inch 25lb. I-beam; K, 7-inch 20lb. I-beam; L, 9-inch 21lb. I-beam; M, 8-inch 22lb. I-beam; N, 10-inch 38 and 33lb. I-beam; O, 6-inch 10lb. I-beam; P, plate girders; Z Z, etc., are cast-iron lintels, and T T. etc., are tie rods securing the beam webs laterally.

Figures 55 to 60, inclusive, show special arrangements at the Park Row and Frankfort Street corner, and, excepting these variations, the beam plans are essentially alike up to the roof. Figure 55 is at the street level; Fig. 56 is on the second tier; Fig. 57, on the fourth tier; Fig. 58, on the fifth tier; Fig. 59, on the eleventh tier, and Fig. 60, on the twelfth tier. Figure 61 shows the roof beam plan. P P, etc., are plate girders under the dome. Figure 62 is a half section through the center of the dome, and is taken through rooms A and C, Figs. 39 and 40. If taken through rooms D D, Fig. 40, another floor would be shown in the 20 foot story. A is a section of one of the dome columns, showing the flange plates D and B, to which the lateral and wall braces are connected.

Figures 63 and 64 are beam plans of the second and fourth dome floors, respectively, and the reference letters designate the same dimensions for the beams as in Figs. 54 to 61. Figure 65 is a plan, and Fig. 68 is an elevation and section of the cast pedestal for one of the wall columns, as at A, Figs. 2, 10, 16, 54, etc.; Fig. 66 is a plan, and Fig. 67 is an elevation, half in section, of one of the interior column pedestals, as at I_c, Figs. 2, 10, 54, etc.; Fig. 70 is a horizontal section through a pair of basement floor beams, as at column K, Figs. 2, 10 and 54, showing the arrangement of bed-plate A, bracket





---

* Part I.—General Description, Location, Perspective View, and Floor Plans was published November 1, 1890.

Part II.—Foundation Plan and Elevations, Details of Piers and Walls, Elevations, Sections and Plans of Dome, was published November 8, 1890.

angles B B, braces D D, and splice bars C C; Fig. 69 is a section at Z Z, and Fig. 71 is an elevation at W W, Fig. 70.

Figures 72 and 73 are elevations, at right angles to each other, of the details of the connection between the interior columns Mc and Nc, and the second story floor beams, Fig. 74 is a horizontal section through the webs of the floor beams* in Figs. 72 and 73; Figs. 75 and 76 are elevations, at right angles to each other, of the pedestal and first tier connections of floor beams to columns, L M and N, Fig. 54; Fig. 77 is a plan of pedestal A, Figs. 75 and 76; Fig. 78 is a horizontal section through the webs of the floor beams, Figs. 75 and 76; Fig. 79 is a detail, showing the segments and re-enforcement plates used to secure the different heavy sections for the lower lengths of the Phœnix columns.

Figure 80 is a complete elevation of column Kc, Figs. 2, 10, 54 and 61, showing all connections from pier to roof. All the column ends are milled to a true bed and exact length, and all the floor beams are carried on heavy steel shelf plates, or diaphragms, inserted between adjacent column sections, and braced, when necessary, by bracket pieces, or gussets. No cast iron whatever is used in the floor-beam connections.

Figure 84 is a horizontal section through column Nc, Fig. 2, and shows a portion of the platform X of the visitors' gallery in the basement; Figs. 81 and 82 are elevations from X X and Z Z, Fig. 84, respectively; Fig. 83 is a section through column Nc, Figs. 81 and 82, showing the detail of connection of the gallery floor beams to the column; Fig. 85 shows details of framing in the lantern; A is 20-ounce copper sheathing.

RECENT WATER-WORKS CONSTRUCTION.

No. XXIII.

(Continued from page 24.)

THE CORNELL UNIVERSITY WATER-WORKS.

Cornell University is located at Ithaca, N. Y., on a hill about 400 feet above the Cayuga Lake, and so far above the business portion of the town that soon after it was established a separate and independent water-supply system had to be provided. It was designed and its construction superintended in 1874-5, by E. A. Fuertes, M. Am. Soc. C. E., Director of the College of Civil Engineering at Cornell, from whose notes and sketches this description and illustrations have been prepared.

Figure 1 is a diagram showing the location of the pumps, reservoir, main pipes and some of the University buildings and dwellings supplied by the system. A few contour lines are sketched in to indicate the topography of the campus and show the hill on whose summit the reservoir A is constructed at a height to furnish ample head for the gravity system. The water, from a mountain stream, is impounded at R by a curved stone dam B, about 100 feet long and 40 feet high firmly seated between the high walls of solid rock which form the banks of the stream.

Water is taken from above the dam through a closed conduit E to the pump-house F, whence it is forced into the reservoir A, and thence distributed under a head that at T is about 90 feet. The lift of the pumps is 145 feet.

An arrangement of valves at P enables the pumps to work directly through the service mains without discharging into the reservoir in case of fire or other emergency.

The original 72,000-gallon pump has been reinforced by two more, with a combined capacity of 3,600,000 gallons per diem.

THE CORNELL UNIVERSITY WATER WORKS
THE ENGINEERING & BUILDING RECORD.
FIG. 1.

The present consumption is about 3,000,000 gallons; used in all laboratories, for fountains and green-houses, to run small turbines and other motors, for making steam for heating and motive purposes, for all domestic uses and for fire protection through about 30 hydrants.

Figure 2 is a plan of the pumping station, etc.

Figure 3 is a section and elevation at V V, Fig. 2. R is a pool that at low water has an area of about four acres and a maximum depth of 25 feet and stores some of the water impounded by the stone dam B. C is a timber bulkhead. The entrance of the inlet E was found to be subject to obstruction from floating ice, etc., and the intake chamber D was built of stone masonry and provided with screen gates at T and U. The gates at the dam proper are moved by a sliding frame worked by a screw. The pump-house F contains three pumps that deliver to the reservoir through the mains H. They are essentially Worthington pumps driven by water at 10 feet head which they receive instead of steam in their cylinders, and discharge through the exhaust pipe G, which greatly increases the efficiency. The pumps deliver into the reservoir against a pressure head of 145 feet. Dam B, though probably possessing some strength as an arch, is stable by gravity and has a packed earth filling, B.

Figure 4 is a plan of the reservoir and Fig. 5 is an enlarged partial section at Z Z, Fig. 3.

The reservoir was built on the French plan of partial excavation and partial elevation. It is 27 feet deep, 100 by 144 feet at the top, and has exterior and interior slopes of 1½ to 1 and 2 to 1, respectively. When filled to the top of the overflow it contains 1,000,000 gallons of water. The excavated loam and gravel was spread directly on the leveled surface of the coarse gravel bed, D D (Fig. 5), and built up in horizontal layers eight or ten inches thick that were rolled and sprinkled with a 1,800-pound cylinder, to form the reservoir walls, S. A two-foot layer of clay puddle C was then spread on the interior sides of the reservoir and the sides were paved with limestone sets F, carefully laid on edge and breaking joints. They were selected of regular size, about 10 by 2 inch to 3 by 6 to 12 inch, and were sound and square. A layer of hydraulic concrete 10 inches thick was carefully laid on the bottom, with the fillet V, one foot in section, about the inner toe of the pitching. Unexpected hindrances had delayed the work so that freezing weather set in before it could be finished, and when operations were discontinued for the winter a layer of straw was spread, much against the designer's wishes, over the bottom and inner sides. When this was removed in the spring it was found to have partly decayed, and left a thick adhesive slime all over the stones, which could not be removed without entirely destroying the paving.

The original design provided a cement lining, which it was attempted to dispense with. Three times the reservoir was filled only to soon empty itself through cracks produced in the puddle at the center of pressure, viz., one-third the distance from the bottom to the top. These cracks were repaired. The pavement F was then grouted with one part of Rosendale cement and two parts of sand, mixed to the consistency of cream, and applied from the bottom upward in a continuous zone about three feet wide, round and round the sides spirally. All the joints of the stones were flooded and each successive passage of the grouting trough forced the grouting into any cracks or open spaces that might have been left lower down. Considerable anxiety was felt lest the slime produced by the straw covering should prevent adhesion between the stones and the grout, but no such difficulty was experienced.

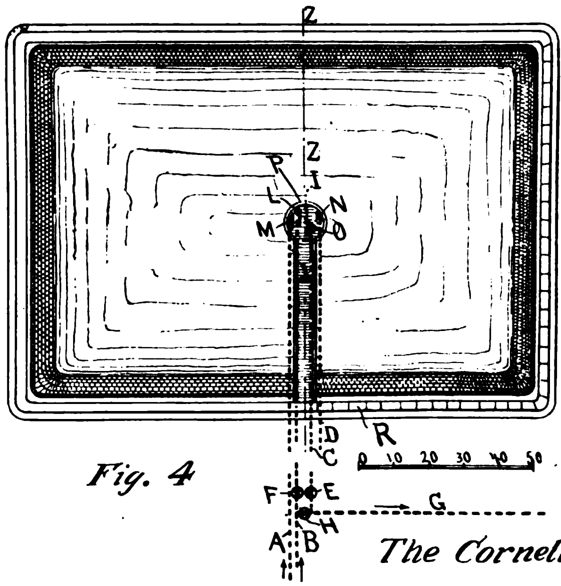

Fig. 4

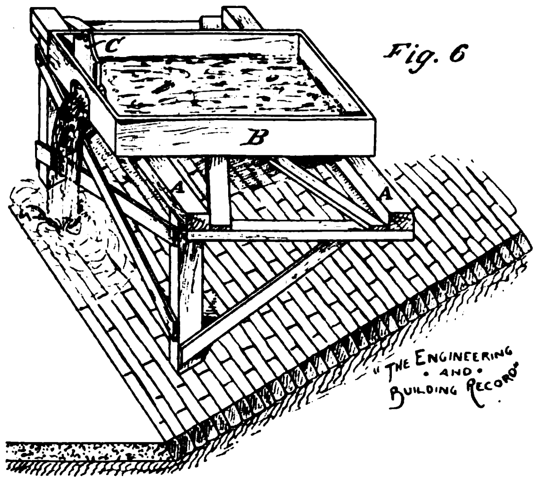

The Cornell University Water Works

The reservoir being built before the arrival of the iron pipes, a gap was left for them in the embankment, and they were laid and the trench (37 feet deep) was filled up in the same way that the walls were built. To prevent leakage along the line of the pipes small pockets about 18 inches apart and 18 inches square were scooped out of the levelled bottom of the trench, and in each a cube of concrete (E E, etc.) was rammed around the pipe, and the filling carefully packed around it. Pipes A and B (fig. 4), are 6 and 8-inch supplies from the pump-house, C is a 10-inch delivery to the consumers, and D is a 12-inch overflow and emptying pipe.

These pipes enter the cylindrical brick well P that is divided by the porous vertical partition wall I, and is floored over to form a platform from which the rack and pinion gears M, L, O and N, controlling the gate valves below are operated.

Overflow pipe D terminates with a stop-gate valve opened by the gear L, when it is necessary to empty the reservoir. A stand-pipe, Q, is connected to the pipe D, adjacent to the emptying gate, and serves for an overflow.

Gear N controls the delivery main, and M and O control the supply pipes. The tower is inclosed by a locked iron fence, and is reached by an ornamental wooden bridge J.

The reservoir is pleasantly located, and a popular resort. A flagstone pavement R is laid around the sides.

Ordinarily the valves F and E are open, and the valve H is closed; and the pumps deliver to the reservoir, but by closing F and E, and opening H, the pressure from the pump pipe B is turned directly into the service main G.

Figure 6 shows the method of grouting the paved slopes.

The grout was mixed in the box B, 3'x7', and delivered as required through the gate C. The box being easily slipped along on the caps A A of a movable frame.

After the reservoir was finished its outside slopes were top-dressed and carefully turfed on the slopes from the bottom upwards, each length being secured by wooden pins and thoroughly set by pounding with heavy wooden mauls.

The total cost of the reservoir was about $8,000, and it has not leaked or required any repairs whatever since its completion in 1875. The entire cost of the works was about $18,000.

ROPE DRIVING.

In a paper on rope driving, read this week at the Richmond, Va., meeting of the American Society of Mechanical Engineers, Mr. Charles W. Hunt stated that the most prominent questions which the engineer wishes to have answered who proposes to make an application of rope driving are those relating to the horse-power, wear of rope, first cost of rope, catenary. The subject is so new that but few accurate data are available, arising from the long period required in each experiment, a rope lasting from three to six years. In many of the early applications so great a strain was put upon the rope that the wear was rapid, and success only came when the work required of the rope was greatly reduced. The strain upon the rope has been decreased until it is approximately known what it should be to secure reasonable durability. Installations which have been successful, as well as those in which the wear of the rope was destructive, indicate that 200 pounds on a rope one inch in diameter is a safe and economical working strain. When the strain is materially increased the wear is rapid. For the purpose of his paper Mr. Hunt assumed this strain of 200 pounds for the normal fibre stress of a manila rope one inch in diameter to be the one which it is advisable to use.

To ascertain the average breaking strength of commercial rope, Mr. Hunt lately purchased four pieces made by different cordage works, and had them tested on the Fairbanks' testing machine in New York. They varied slightly in diameter, but when reduced to the equivalent of a rope one inch in diameter had an average breaking strength of 7,140 pounds. Expressed algebraically, the breaking strength, weight per foot, and the working strains are:

$$W = 720\ C^2$$
$$P = .32\ C^2$$
$$w = 20\ C^2$$

In these equations $C =$ circumference of rope in inches.

This makes the normal working strain equal to one thirty-sixth of the breaking strength, and about one twenty-fifth of the strength at the splice. The actual strains are ordinarily much greater, owing to the vibrations in running, as well as from imperfectly adjusted tension mechanism.

The centrifugal force of the rope in running over the pulley will reduce the amount of force available for the transmission of power. The centrifugal force of the rope is computed by the formula:

$$F = \frac{P\ v^2}{g},$$

P being the weight, in pounds, per foot of rope; v, the velocity of rope in feet per second; and g, gravity. At a speed of about 80 feet per second the centrifugal force increases faster than the power, from increased velocity of the rope, and about 140 feet per second equals the assumed allowable tension of the rope. Computing this force at various speeds, and then subtracting it from the assumed maximum tension, we have the force available for the transmission of power. The whole of this force cannot be used, because a certain amount of tension on the slack side of the rope is needed to give adhesion to the pulley. What tension should be given to the rope for this purpose is uncertain, as there are no experiments which give accurate data, and at the present time a decision must be made partly from analogy and partly from experience.

If the rope be considered as a belt on a plain pulley, the friction would be substantially the same as a leather belt at the same tension, but as ropes are frequently lubricated to reduce the wear, the co-efficient of friction must be materially reduced. There have been no experiments to decide with accuracy what this reduction is, but it is known, from considerable experience, that when the rope runs in a grove whose sides are inclined toward each other at an angle of 45 degrees there is sufficient adhesion when the ratio of the tension is

$$\frac{T}{t} = 2,$$

T, being the tension, in pounds, of driving side of rope and t the tension on slack side of rope.

T can be divided into three parts:

Tension doing useful work.
Tension from centrifugal force.
Tension to balance the strain for adhesion.

The tension t can be divided into two parts:

Tension for adhesion.
Tension from centrifugal force.

It is evident, however, that the tension required to do a given work should not be materially exceeded during the life of the rope.

There are two methods of putting ropes on the pulleys; one in which the ropes are single and spliced on, being made very taut at first, and less so as the rope lengthens, stretching until it slips, when it is respliced. The other method is to wind a single rope over the pulley as many turns as needed to obtain the necessary horse-power and put a tension pulley to give the necessary adhesion and also take up the wear.

Transmission ropes are usually from 1 to 1¾ inches in diameter.

The first cost of the rope will be smallest when the power transmitted by it is greatest.

The wear of the rope is both internal and external; the internal is caused by the movement of the fibres on each other, under pressure in bending over the sheaves, and the external is caused by the slipping and the wedging in the grooves of the pulley. Both of these causes of wear are, within the limits of ordinary practice, assumed to be directly proportional to the speed. Hence, if we assume the co-efficient of the wear to be k, the wear will be kv, in which the wear increases directly as the velocity, but the horse-power that can be transmitted will not vary at the same rate.

ACTION OF ALUM ON MICROBES IN POTABLE WATER.

In the *Chemical News* for October, page 177, there is an interesting reference to the use of alum for the removal of organic matter in suspension and in solution in drinking water. It is well known that when alum is added to ordinary water it is decomposed, its sulphuric acid combining with the lime, and its alumina being thrown down in combination with the organic substances which are present. Along with this precipitate and entangled with it the microbes are also mostly precipitated.

The *Chemical News* states that since this method has been adopted by the French troops in Tonquin they have enjoyed a nearly complete exemption from dysentery. This method was employed in preference to boiling the suspected water, the facilities for doing which were not always at hand.

THE OMAHA, NEB., WATER-WORKS.

The improvements now being made in connection with the Omaha, Neb., Water-Works involve the construction of a new reservoir at the river and a generally improved system of filtering the water after it has been pumped from the river. The plans contemplate the erection of a stand-pipe at the river, near where the present second pumping station is located. The water will be pumped directly into this from the river, and will then be conveyed in large mains to the reservoirs around the central pumping station. The new reservoir will be located east of the present two, and they will all be connected by weirs instead of pipes as now, over which the water will flow in a broad thin sheet, less than half an inch deep. It is estimated that this system will cause the deposit of about 70 per cent. of the silt in the primary reservoir, and by the time it reaches the final basin from which it will be pumped into the Fairmount Park reservoir, it will be relieved of nearly all matter held in suspension.

A Florence, Ala., dispatch states that after years of work the canal around Muscle Shoals, in the Tennessee River, is at last completed. and will soon be formally opened. It will enable the passage of boats from Florence to Knoxville.

FIRE-PROOF DOORS.

In our issue of September 21, 1889, we illustrated a form of fire-proof door which is made the subject of further comment in a circular recently issued by the Boston Manufacturers Mutual Fire Insurance Company. Some of the particulars there given will bear repetition.

There are a number of applications of fusible solder for the purpose of closing the door when the temperature rises to 162 degrees; but whatever method is used, the doors should always be kept closed, except during working hours, and even in working hours when it is feasible.

The tin-covered doors may be hung on hinges or at doorways when such form would be more convenient; but in such instances it is important to maintain a constant supervision in order that the doors shall not be held open by objects placed on the floor in front of them.

When this form of construction is used for window shutters, it is important that they should always be closed at night. The great fire at Lynn, in November, 1889, was stopped in a westerly direction by the resistance of a large building protected by this type of shutter, although a burning frame building, three stories high, had fallen against this building, the heat of the fire being sufficient to melt the tin from the plates and to reduce much of the wood in the shutters to charcoal. As air cannot reach the wood in these shutters, the wood may be slowly carbonized, but rapid combustion is impossible. At the opposite extremity of the burned district, a large bank building provided with a different type of shutter was burned. Efforts were made to close the shutters, but as they had been kept open for 25 years they were rusted in position so firmly that it was impossible to move them.

It is recommended that shutters and fire doors should be painted with a light paint, which tends to reflect the heat. A dark paint tends to absorb it.

COST OF DREDGING.

In an article on dredging operations in the East, the London *Engineer* states that the cost of dredging in Portsmouth harbor, which more than ten years ago was eight pence per cubic yard, has now been reduced to three and one-half pence. Similar reductions have been made in the United States, Canada and the West Indies, due entirely to improvements in dredging machinery during the past ten years. In India and the Eastern colonies, however, there are no signs of such reductions, the cost per cubic yard being as high as from 1*s*. 6*d*. to 4*s*. 6*d*. per cubic yard. The reason as given by the *Engineer* is that dredges 20, 30 and even 40 years old are employed upon such work in the East. In one case a dredge was stopped for repairs 120 out of 180 days of employment. These unfortunate machines, it says, "are kept wheezing and grinding along years after they should have been broken up for old metal."

WATER-SUPPLY OF LONDON AND GLASGOW.

The Corporation Committee, which has been sitting, under the Presidency of Sir William Guyer Hunter, since May last, to report on the question of the London water supply, has presented its report. The question is really a revival of that considered by the Parliamentary Select Committee on London Water Supply, held in 1880. This Parliamentary Committee reported that it was desirable in the interests of the public that the Metropolitan Water Supply should be vested in the hands of a public body, and that it should not, as now, be under the control of private companies. The city of Glasgow affords, to a certain extent, a parallel to existing conditions of London. Previous to 1855 Glasgow was supplied by two companies, and at that date authority was obtained to take over the undertakings. The authorities have reason for satisfaction at the results. Mr. Gale, the Engineer, states that the daily supply per head in Glasgow is 49.84 gallons, the water charge on a house of £50 rental is £1 9*s*. 2*d*. per annum if within the Municipal boundary, and £2 1*s*. 8*d*. without. In London the average daily supply per head is stated at 29.91 gallons, while the charge for a house with £50 rental ranges from £2 4*s*. 0*d*. to £3 17*s*. 0*d*. per annum, according to the company making the supply.

The favor with which American machinery is regarded abroad is, in a measure, illustrated by the fact that the Ingersoll-Sergeant Rock Drill Company, of New York, have received a second order for a plant of submarine drilling machinery for removing the Iron Gates of the Danube River, Austro-Hungary.

MAGNESIA IN PORTLAND CEMENT.

IN view of the recent decided scare, particularly abroad, as to the deleterious effects of magnesia in Portland cement, special interest is attached to some rather reassuring tests results arrived at by Dyckerhoff, and recorded in the *Thonindustrie Zeitung*.

It appears that experiments were made with a series of cements containing magnesia in proportions ranging from 1.9 to 21.24 per cent.

A condition of the utmost weight, and too often overlooked in researches of the kind, was in this case scrupulously complied with; ample time was allowed for the development of latent defects, the experiments extending over two years. All the cements dealt with increased in strength up to the end of six months, although those containing most magnesia were weaker than the others. The three containing the largest proportion of magnesia, viz., 10.82, 17.80, and 21.24 per cent. respectively, began at this point to retrograde rapidly. The other specimens, containing 6.23 and 11.36 per cent., increased in tensile strength up to twelve months, and then gave evidence of retrogression. It was also proved that the temperature at which the cement had been burned was of considerable influence, lightly-burned cements growing weaker sooner than those made from well-burned clinker. This is in no way surprising, for it is a well-known chemical fact that the exposure of magnesia to a very high temperature renders it almost inert, or, to speak more exactly, slower in its reaction with water, the product slacking very gradually, and remaining caustic for a considerable period.

To sum up, then, it is plain that magnesia in tangible amount, *e. g.*, over 5 per cent., is distinctly dangerous, and cement containing such a proportion should be rejected without appeal, but the moderate quantities found in ordinary cements of good quality are thoroughly innocuous, and rejection based on their presence is considered capricious and unreasonable.

A RAILROAD APPROACH TO NEW YORK CITY.

L. L. BUCK, writing in *The Railroad Gazette*, says that in 1876, while looking over a map of New York City and its vicinity, it occurred to him that Long Island and Staten Island were favorably situated to afford a very superior route for railroads to approach New York from the south and west. A further study of the subject satisfied him that it might at the same time be made a connecting link between railroads coming in from the former points and those coming in from the east and north.

The plan was to cross the Arthur Kill at some convenient point, by a bridge from New Jersey to Staten Island, thence on Staten Island to the Narrows, thence by a tunnel under the Narrows and Bay Ridge to Long Island, thence through or around Brooklyn to the vicinity of Lawrence's Point, and thence by a tunnel under the East River to Westchester, where it could form a junction with the various railroads coming in from the east and north.

From all that could be learned of the character of bottom of the Narrows, it did not appear to be such as to present very serious obstacles to driving a tunnel through it, and Mr. Buck believed that a tunnel might be so constructed as to be permanent. He gave this part of the problem considerable study.

The advantages of the route are pointed out as follows:

1. The great facility it would afford in reaching New York. The city of Brooklyn is now well supplied with a system of elevated railroads, terminating at various important points on the East River. Two or three substantial bridges could be built across this river for what one would cost across the North River from Jersey City or Hoboken, and these bridges would have the decided advantage of distributing the traffic over a proportionately greater number of convenient points in New York City, while the railroads from the north and east would continue to enter the city by their present routes, By these means a very material assistance would be given to the solution of the rapid transit problem in New York.

2. It would place Long Island and Staten Island on a through line of railroad ; a very important consideration, when it is remembered that the large and rapidly growing city of Brooklyn is completely isolated from the mainland. These islands would also have their value as suburbs greatly enhanced.

Branch tracks extending along the shores of the Bay and the Brooklyn shore of the East River would be of decided benefit as terminal facilities,

3. The advantages that such a railroad would afford in receiving and shipping goods might soon cause the erection of large storage warehouses around the outskirts of Brooklyn, where heavy goods could be received and repacked for shipment directly by rail instead of bringing them to New York and carting them about the streets by horse-power, thus saving a large percentage in the cost o handling and preventing the present crowded condition o the streets from becoming much worse.

Finally, no more direct route connecting New England with the South, West, and the coal regions be found than by the line above described.

A bridge has already been built across the Arthur Kill, and a railroad on Staten Island. A movement is now on foot to tunnel the Narrows and extend the railroad on to Long Island. That the improvement will end there Mr. Buck does not consider as at all probable,

CAUSTIC LIME FOR PURIFICATION OF SEWAGE WATER.

DR. H. WEIGMANN, of Kiel, Germany, contributes to the *Gesundheits-Ingenieur* an interesting article on the above subject. In the pamphlet of foreign abstracts of the British Institution of Civil Engineers, the following resumé of it is given :

While admitting that the purification of sewage water by means of irrigation is the more perfect system of treatment, Dr. Weigmann points out that in certain cases some chemical process has, for various reasons, to be employed. Notwithstanding the numerous substances which have been proposed, lime still holds the foremost place. The caustic lime combining with the carbonic acid gas, a product of decomposition always present in sewage water, yields a bulky precipitate of calcic carbonate, which mechanically entangles the suspended impurities, and effects a rapid clarification.

Recent experiments respecting the action of lime have shown this substance to possess such excellent disinfecting properties that it seems that the lime treatment is among the best of the precipitation processes. As one result of the use of lime, it is pointed out that the substances in solution are thereby invariably increased rather than diminished in quantity, though the recent researches of Schreib tend to controvert this theory. In order to arrive at accurate conclusions, careful estimations of the amount of chlorine in the sample, both before and after treatment, are advisable. Dr. Weigmann's experiments have led to the conclusion that from the clarified effluent after the lime treatment there is a considerable evolution of ammonia and other nitrogeneous gases, and he states that though water which has been rendered so strongly alkaline as to destroy all the bacteria therein cannot decompose so rapidly as water teeming with bacteria (which are the active exciters of putrefactive changes), there can be no doubt that. owing to the dissolved lime, an important change takes place in the condition of the organic substances in solution. Dr. Weigmann insists upon the necessity for a rapid separation of the sludge from the water in order to put an end to the changes which take place in the organic matters entangled with the calcic carbonate, and points to the advantages, on chemical grounds, of passing the sludge through a filter-press, as soon as possible after deposition, as is done, for instance, in the works at Halle.

In addition to its powerful action in destroying the bacteria and germs of every kind, there can be no doubt that lime is a strong disinfectant. The tendency of alkaline sewage-water, after it has, by means of carbonic acid gas in the atmosphere or in the river water, parted with its dissolved lime, is to become again rapidly charged with bacteria; but these are by the self-purification powers of running water speedily rendered innocuous or converted into the food-stuff of water-plants, and it is pointed out that the previous lime precipitation has removed all the germs of a pathogenic character, and the new growth of bacteria are probably of a non-dangerous character.

THE School Board of St. Paul, Minn., has requested the Board of Health to make a thorough investigation and examination of the sanitary condition of all public school buildings in the city. This action has been prompted by recent severe criticisms of the city's schools.

THROUGH the generosity of James Lick, San Francisco has been provided with a public bathing institution, which has just been made ready for use.

THE ONEGA WHITE SEA CANAL.

THE preliminary surveys for the projected Onega White Sea Canal have been completed. The British Vice-Consul at Archangel, Russia, in his last report, says that the following facts have been established. The level of the White Sea is about 15 feet higher than that of the Lake Onega, and the length of the proposed canal would be 219 versts, of which 129 versts are a natural waterway. The proposed measurements of the canal are: Breadth, 63 feet; at the locks, 112 feet; and along its other portions the proposed depth is 10 feet. The cost is estimated at about 7,500,000r.—£800,000 — not including the expenses incurred in the construction of a port at a point on the coast of the White Sea. With the construction of the canal it is expected that the cost of transport of goods from St. Petersburg to Archangel will be diminished from 1r. per pood to 40c. The canal will afford every facility for the transport of fish from the plentiful fishing grounds of the White Sea to St. Petersburg, and also for the transport of the mining products of Olonets. It will also be of great stragetical importance in connecting St. Petersburg and Cronstadt with the White Sea. There can be no doubt, the Vice-Consul thinks, that, considering the unlimited supply of timber in the province of Olonets, and the enterprising character of the population, shipbuilding will be carried on on a large scale when the canal is constructed.

DISPLACING A WATER MAIN WITHOUT STOPPING THE SUPPLY.

IN connection with our recent articles on lowering water mains without interrupting the supply, a communication on the same subject, contributed to the *Journal of the Royal Institute of Engineers*, of Holland, by T. Stang, Superintendent of the Municipal Water-Works, at the Hague, is of interest. An abstract is given in the Excerpt Minutes of the Proceedings of the British Institution of Civil Engineers.

It appears that the extension of the town of the Hague made it necessary to alter the position of the main conduit of the water supply. An interruption in the service would have entailed great inconvenience, and as the intended change was comparatively slight, Mr. Stang resolved to try slewing the main sideways without stopping the supply even for a moment. The main, when flowing full, weighs 260 kilograms per lineal meter (524 pounds per yard), the length to be moved being 250 meters (273 yards), made the total mass a weight of 65 tons. When the main had been laid bare and found in excellent condition, a trench was dug alongside reaching a little deeper than the underside of the pipe, which was then suspended by chain slings and screw-bolts and nuts to beams laid across the trench. While the nuts were being turned, over the whole length of the operation, and at the same time slid sidewards, the earth on which the main had been resting was slowly dug away, allowing the main to swing sideways. This operation was repeated two or three times till the pipe was in its desired position. During this time the pressure was reduced from 3 to 1½ atmospheres. No leaks of importance occurred in the lead joints, and where slight ones were observed they were easily calked.

ACCORDING to an account from San Juan del Norte, Nicaragua, Senor Don J. F. Medina, Minister of Public Works, has advised the general agent of the Maritime Canal Company at Managua, Henry C. Hall, that the company has more than fulfilled its obligations as to expenditures upon the work under the requirement of its concessions. The government of Nicaragua has sent congratulations to the company on account of the satisfactory results and favorable prospects. The company has expended upon the work in the last year more than $3,000,000, and has now, by the terms of the concession, 10 years during which to construct the canal.

A LONDON correspondent writes: "An extraordinary defence was entered by the Shoreditch Vestry in an action brought against them recently by a firm of manufacturing chemists. Owing to subsidence in the roadway at Dalston, a horse belonging to the plaintiffs had been injured, and the action was brought to recover damages. The Vestry, in defence, stated that the roadway had been undermined and honeycombed by rats, and the subsidence was a consequence and not due to negligence on their part. The jury accepted the defence and returned verdict for the Vestry. Inspection which permits undermining by rats to such an extent as to endanger a roadway would appear to be peculiarly and particularly superficial."

BUILDERS' AND CONTRACTORS' ENGINEERING AND PLANT.

No. CV.

(Continued from page 362.)

UNDERPINNING YARMOUTH CITY HALL.*

THE City Hall of Yarmouth, England, is about 130 by 106 feet, and 50 feet high to the cornice, and has a total estimated weight of 5,000 tons. The clock tower, Z, Fig. 1, is 108 feet high, weighs 700 tons, and has a base 20 feet square. The building stands on soft, wet soil about 70 feet from the river Yare. It began to settle soon after its completion, and within four years was considered so unsafe that it was determined to rebuild portions of it. The first plan, to put a mass of concrete under the foundations, was abandoned on account of the difficulty of draining the working trenches without endangering the walls. It was proposed to widen the foundations by putting wrought iron girders under the brick masonry, and supporting them on concrete piers level with the ground surface. Finally, the west, or river, front having settled one foot at its extremities and 6 inches in the middle, the north and south walls began to crack and the building to tip over towards the river, and it was determined to demolish the west wall and rebuild it on firmer foundations. Duckham & Teasdel then proposed to restore the walls to the level of least settlement and assure their future stability, with less delay and expense than the reconstruction would require, and were awarded the contract for the work, which they accomplished as shown in Figs. 1 to 9 inclusive.

Figure 1 is a half plan of the building, whose walls Y Y, etc., are shown in section, and their footings, X X, etc., in elevation.

Figure 7 is a section of the main wall at any point, as U U, Fig. 1, and shows the foundations as repaired.

Figure 8 is an elevation from S S, Fig. 7, with the new concrete, W, omitted.

Figure 2 is an enlarged elevation from P P, Figs. 7 and 8.

Figures 3 and 4 are elevations from T T and R R, Fig. 2, respectively.

Figure 5 is a section at X X, Fig. 2.

Figure 6 is a section and elevation at Q Q, Fig. 1.

The walls were first braced as shown in Fig. 9, then the cast-iron piles A A, etc., were sunk about 40 inches in the underlying gravel, and filled with concrete. The piles were 22 feet, 6 inches long, 1⅝ inches thick, and 30 inches in diameter where they supported a 35-ton wall, and 36 inches where it was a 50-ton wall. The concrete core was designed to form a column able to carry all the load if the iron shell should be totally destroyed. Longitudinal girders D were then set on the piles, and from them were suspended by 2 inch bolts J J, etc., and bearing plates I I, etc., 16-inch transverse beams E E, etc., from 14 to 16 feet long. Their flanges were 6 inches wide, reinforced by 12-inch plates K, on top where they supported the old concrete footing V. H H are friction washers. The tower piles A¹ A¹, etc., were 4½ and 5 feet in diameter and connected by the small beams M, on which the riveted girders L L were set, and carried transverse girders E, connected as shown in Figs. 2, 3 and 4, to support the walls. By adjusting the suspension bolts J J, etc., all the transverse beams were brought to bearing under the wall, and, lifting it to the required level, transferred its weight entirely to the piles A A, etc.

A trench was then dug under the foundations, and a new concrete footing W, Fig. 7, put in that enveloped the tops of the piles, and all the other iron work.

The work was satisfactorily accomplished in about 12 months at a cost within the contract price of $41,400.

MILL COLUMNS.

TIMBER posts, according to a circular recently issued by the Boston Manufacturers Mutual Fire Insurance Company, offer more resistance to fire than iron pillars, and have generally displaced them in mill work, being preferable in many respects.

Experiments made for the company on the testing machine at the United States Arsenal at Watertown, Mass., show that sound timber posts of the proportions customarily used in mill work yield by direct crushing and not by crippling, the strength being directly as the area of cross-section at the smallest part. The columns yielded at about 4,500 pounds per square inch, confirming the general practice of allowing 600 pounds per square inch as a safe load. Square columns are, therefore, one-fourth stronger than round ones of the same diameter, and do not interfere to any greater extent with the floor space.

It has been the general practice to bore a hole 1¼ inches in diameter along the axis of the column for the purpose of reducing checking, but later methods are to leave the columns solid. It may be safer to bore the holes for ventilation, lest, by inadvertence, posts made of unseasoned wood should be painted, varnished, or filled, so as to promote fermentation, or what is commonly called "dry rot."

There is no part of a mill where good work is more essential than at the columns. It is recommended that the cap, pintle, and base be made of one piece of cast iron, instead of three, as is the present general practice.

ANNUAL REPORTS.

ANNUAL REPORTS OF THE CITY OF GLOUCESTER, MASS., for the year 1889.

The report of the City Engineer, Winslow L. Webber, refers mainly to the laying out of new streets and widening of old ones, and furnishing plans for a variety of purposes. Attention is directed to the plans for a complete system of sewerage for the city, recently made by Ernest W. Bowditch, Civil Engineer, which are now before the State Board of Health for their approval. The plans call for a separate system at an estimated cost of $325,000.

ANNUAL REPORT OF THE SUPERINTENDENT OF THE JOLIET, ILL. WATER-WORKS, April 30, 1890.

During the administration of the present Superintendent, J. F. Gleason, the amount of water supply has been greatly increased by a system of drive wells, 20 in number, which, with the aid of the four old artesian wells, now yield a supply to the city of over 3,000,000 gallons per day. A new duplex condensing pumping engine of 3,000,000 gallons capacity in 24 hours, built by the Edward P. Allis & Co. Reliance Works, of Milwaukee, Wis., is in process of erection. The average cost of pumping for the year was $8.30 per million gallons, and the cost per million gallons, including all expenses of maintenance and interest on bonded debt, was $28.75. The total amount of water pumped during the year was 637,704,000 gallons.

ANNUAL REPORT OF THE SEWER COMMISSIONER OF THE CITY OF ST. LOUIS, for year ending April 7, 1890. Robert E. McMath, Sewer Commissioner.

This report gives an account of an accurate survey o the city now in progress, in addition to the usual work of the Sewer Department. The large Mill Creek Sewer, it seems, is approaching completion, as it is hoped that the last section will be completed during the current year. Editorial reference is made in another column to the method pursued in making the surveys.

SEWERAGE AND WATER SUPPLY OF ST. JOHN, N. B. Superintendent's and Engineer's Report, 1889.

The report gives an account of the work done in connection with the sewerage and water supply systems during the year 1889, and shows the present condition of the works on both sides of the harbor. There was added to the water distributing system during 1889 1,615 feet of main pipe and 2,039 feet of leaden service pipe.

With the additions made in 1889 the whole length of distributing pipe in use at the end of the year was 385,184 feet. Measured by the miles of pipe laid there was one leak for each three miles of main and one on each service pipe for each seven-tenths of a mile laid—including such as arose from blasting and sewerage works.

In the section on sewerage the several systems of Carleton, Portland, and St. John (East), which are now under the supervision of one engineer, Gilbert Murdoch, C. E., are briefly reviewed.

Novelties.

Devices are described under this head purely and strictly as news; because believed to be new and calculated to interest readers.

In no case is pay accepted, directly or indirectly, for publishing a novelty notice.

As the subjects are selected for their supposed novelty and interest merely, it will, of course be understood that the selection does not imply indorsement.

FLEXIBLE TUBING.

At the Richmond, Va., meeting, this week, of the American Society of Mechanical Engineers, Mr. T. R. Almond exhibited and described a novel form of flexible tubing, designed to convey gases, steam, or liquids under considerable pressure. The tubing was claimed to have sufficient flexibility for all practical purposes, with the additional advantages of great strength and durability.

When a tube is formed by coiling a wire around a mandrel, the convolutions may be made to press upon each other with considerable force, and the joint formed at the point of contact of the individual convolutions will be tight in proportion to the amount of pressure exerted. If such a tube be bent, the joints will be broken all around the coils except at one point, and therefore, when bent, it is useless for conveying liquids or gases.

Wishing to utilize the peculiar flexibility of spiral spring tubing for the conveyance of gases in cases where a flexible tube is required, Mr. Almond conceived the idea of interposing a triangular-shaped wire between the coils of a round wire. When a tube so constructed is bent, the convolutions of the tringular coil adjust themselves to the spaces between the round coils, as shown in Fig. 1. The triangular wire is pressed between the coils of the round wire, during the process of constructing the tube, with sufficient force to spread them apart, so that the contact surfaces are at all times under pressure. The triangular wire serves two purposes: one is to spread the coils apart, so that the pressure will be exerted on the contact surfaces; the other, to fill the irregularly shaped spaces between the coils of round wire, adjusting itself to the changing form of the spaces due to any given flexion. This pressure brings into play the element of friction to such an extent as partly to destroy the flexibility of the tube, which, when bent, will retain the form given to it. This was an unlooked for and unexpected quality. As the primary object was to obtain a flexible tube, trials were made with wire having a more obtuse angle. This gave better results, as a more perfect joint was produced with less tension of the inner coil, and the friction became correspondingly less, the result being a tight tube with sufficient flexibility.

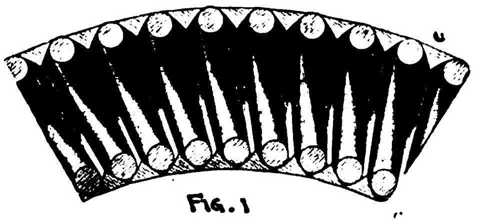

Fig. 1

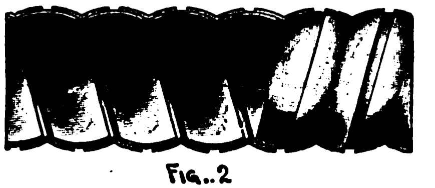

Fig. 2

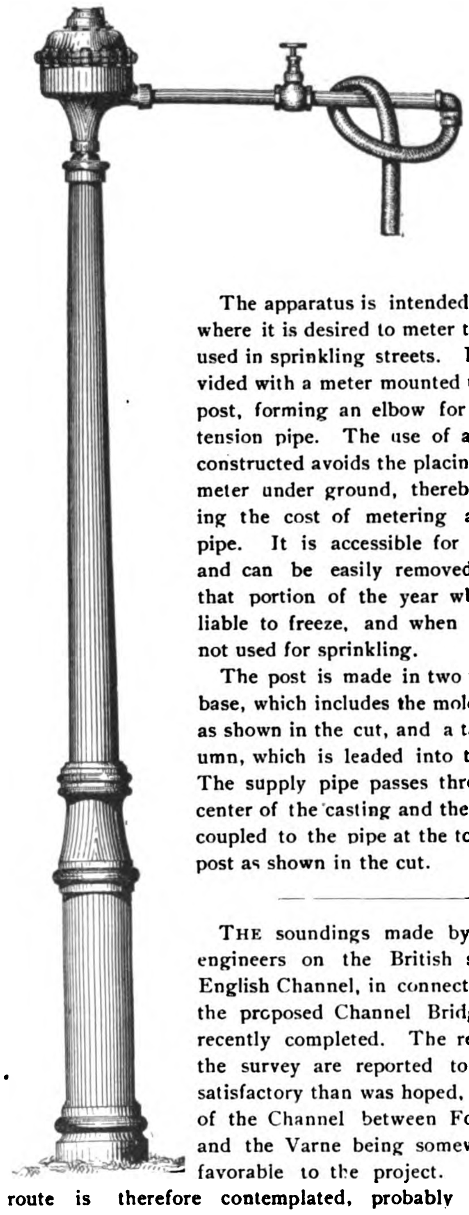
Flexible Tubing

The degree of flexibility depends upon the amount of tension put upon the inner coil, or the extent to which the convolutions are forced apart. Mr. Almond claims to have produced a perfectly tight tube with two coils of round wire, in which the outer coil is wound sufficiently tight between the convolutions of the inner coil to spread them apart for the purpose of getting pressure on the joints, substantially the same as with the triangular wire. This, he says, makes a very strong tube, but is too bulky for many purposes. Two half-round wires, or even less than half-round, may be used; or the inner wire may be round, and the outer half-round, or much less than half-round. The tubes will then be less bulky.

Mr. Almond has made several tubes in which the contact surfaces of the coils are made to coincide with a circle whose center is the axis of the tube. The joints so formed are practically a series of ball and socket joints; such a tube has smoother outer and inner surfaces than those previously described. It is pointed out that a serious objection to such a tube is that the wire changes its shape during the process of coiling, so that the joint surfaces will not make sufficiently complete contact, whereas the forms of wire previously mentioned are of simple construction, and the slight change of form which occurs during the process of coiling will not affect the result. The extent to which this tubing may be bent without leakage is said to be considerable. A piece of ¼-inch bore is claimed to have been subjected to a steam pressure of 75 pounds without leakage; the smallest curves of the bent portion corresponded in this case to a circle two inches in diameter. Tubes larger than 5/16-inch bore have not yet been made, but it is thought possible to make them as large as 1-inch bore, and strong enough to stand any ordinary steam pressure. For purposes where pressure is not required, the tube may be made of sheet metal, shaped as shown in Fig. 2, which may possibly be made as large as two inches in diameter.

WATER CART STAND-PIPE.

The Hersey Manufacturing Company, of South Boston, Mass., have designed and are about to put on the market the water cart stand-pipe shown in the annexed cut.



The apparatus is intended for use where it is desired to meter the water used in sprinkling streets. It is provided with a meter mounted upon the post, forming an elbow for the extension pipe. The use of a post so constructed avoids the placing of the meter under ground, thereby reducing the cost of metering a stand-pipe. It is accessible for reading, and can be easily removed during that portion of the year when it is liable to freeze, and when water is not used for sprinkling.

The post is made in two pieces, a base, which includes the molded part as shown in the cut, and a taper column, which is leaded into the base. The supply pipe passes through the center of the casting and the meter is coupled to the pipe at the top of the post as shown in the cut.

The soundings made by French engineers on the British side the English Channel, in connection with the proposed Channel Bridge, were recently completed. The results of the survey are reported to be less satisfactory than was hoped, the floor of the Channel between Folkestone and the Varne being somewhat unfavorable to the project. Another route is therefore contemplated, probably between the nearest land points, namely, Cape Grisnez and Dover.

COMPRESSED AIR FOR SANITARY PURPOSES.

In an article bearing on the development of compressed air distribution systems in some of the larger German cities and towns, the *Gesundheits-Ingenieur* explains how water may be raised by compressed air and made available for fire extinguishing purposes. It is shown, further, how this agent can be utilized for emptying cesspools and discharging the contents into tank wagons for removal. The value of compressed air for ventilating is also pointed out.

Questions and Answers.

All questions relating to building construction, paving, sewerage, water supply, or kindred subjects, will be welcomed in this column provided they relate to matters of general interest and are not such as should properly be referred to a consulting engineer. Answers will be carefully prepared and a proof of both question and answer mailed to the inquirer as early as proper consideration will permit. They will be published for the benefit of other readers as soon as convenient. The full name and address should be given, not necessarily for publication, but as a guarantee of good faith, and to facilitate further correspondence in case the question is not sufficiently explicit.

Inquiries of the Editor, in order to secure prompt attention, should *not be written on the same piece of paper as a communication* to the *Publishing Department*. Letters renewing subscriptions are sent to a clerk in the publishing office, and matter for the Editor, if in the same enclosure, is likely to be overlooked unless it is on a separate piece of paper, so that it may be promptly sent to the Editor.

BRIDGE DESIGN AND FACTORS OF SAFETY.

V. S. Hopkins, Williamsville, New York, writes: "Please give me the average load taken in designing common road bridges, sometimes carrying threshing engines. Also give me the loads taken for railroad bridges, and the factors of safety."

[There is no average load assumed for designing common road bridges. Some have been built that fell down under their own weight as soon as completed, and others that would support any load that could be placed upon them.

Most bridge engineers separate ordinary highway bridges into at least three classes, city, suburban and country bridges, which are, in general, respectively designed for heavy, moderate and light loads. One part of the bridge may be suitably adapted for heavier loads than another part, or than the whole structure is. Short spans should be designed for greater loads per lineal foot than long ones. Those in exposed situations must provide for heavy windstrains, which can be greatly reduced in other cases, and in all cases both safety and economy require a consideration of locality, and conditions and adaptation to the usual and possible traffic, which, with the details of construction, should be approved by a competent bridge engineer.

Several comprehensive specifications for highway bridges have been published by Theodore Cooper, J. A. L. Waddell, and other engineers, and they require from 50 to 100 pounds or more per square foot of floor surface, and wind strains up to 300 pounds per lineal foot. Provision is also generally made for concentrated loads of from 4 to 16 tons on one or two pairs of wheels. It is still less possible to state any general requirements for railroad bridges which are subject to infinite variations of traffic, and are built under all conditions of design and construction. The growing tendency now is to proportion certain parts of the structure so as to gain great stiffness and solidity by an increase of mass beyond the requirements for the simple strains.

A single-track railroad bridge should be proportioned to carry two of the heaviest locomotives used on the road, followed by a train of the heaviest loaded cars. Provisions for high speeds, impact, brake action, multiple tracks, etc., require the most careful and expert consideration.

There is no such thing as a factor of safety, and no general rule whatever for the intensity of stress in bridge members. The working stress in a part may be from one-half to one-tenth or one-twentieth of the amount per square inch that is supposed to be necessary to destroy it at the first application. In that case 2, 10 or 20 is said to be the factor of safety; but it is not so in any proper sense, as the strains should be proportioned entirely according to the conditions of working design of the members, materials used, treatment in manufacture, etc., etc.]

The new water-works pumping engines at the Toronto, Ont., high-level pumping station were handed over to the city on October 27. The plant consists of two compound high-duty pumping engines. The George F. Blake Company of Boston supplied the water cylinders, while the steam cylinders, boilers and all other parts of the complete machinery were built by the Polson Iron Works Company of Toronto.

Anent the recently much-talked-of natural gas scarcity in and around Pittsburg, it now appears that many of the statements have been far from the truth. It is stated, on good authority, that the iron and steel plants in the Pittsburg district affected by the recent rise in the price of gas are very few when compared with the total number now using that fuel.

DOMESTIC PLUMBING HEATING LIGHTING & VENTILATION ENGINEERING

STEAM HEATING IN THE BOSTON AND ALBANY RAILROAD STATIONS AT SPRINGFIELD, MASS.

WE show, in the accompanying cuts, foundation plans of the new adjoining stations at Lyman and Liberty Streets, Springfield, Mass., of the Boston and Albany Railroad Company, illustrating the main features of the steam heating system with which they were equipped by Messrs. Norcross Brothers, of Springfield, under the superintendence of Mr. E. M. Harding, now with the United States Heating and Plumbing Company, of Boston, Mass.

The boilers, which are of the Hennessy triple-draft pattern, designed for using oil fuel on the plan of the Aerated Fuel Company of Springfield, are located in a detached boiler house, about 1,000 feet west of the two stations, and carry a pressure of 80 pounds, supplying, as they do, steam for electric light engines also. The boilers, four in number, are all connected with one 10-inch steam drum, from which the supply pipes for heating and power are taken.

The steam for heating is used at reduced pressure—not over five pounds—both direct and indirect radiation being employed, with gravity return. The stacks of indirect radiators are designated by the letters H, the numerals at the right indicating the number of sections. These are of cast iron, with extended surface suspended from the ceiling by heavy wrought iron hangers. Each stack is incased in two thicknesses of wood, consisting, first, of a box of sound flooring lined with tin, the bottom being removable; and, second, of an outer covering of matched and beaded stuff, with a layer of heavy building paper between, put together with screws. The air supply to the stacks for the smoking rooms, restaurants, and women's waiting-rooms, on each side of the middle portions of the buildings, is taken direct from the outside; for the main waiting-rooms in the middle, however, a system of interior circulation has been adopted, the air being taken from the rooms through registers F in the floor at convenient points, passed through the radiator stacks, and discharged again into the rooms. It is thought that a sufficient supply of fresh air to these rooms is maintained by the continual opening and closing of the doors leading to the outside.

The fresh air supply is led through ducts D, along the basement ceiling. Each duct, where connecting with the outside, has a galvanized wire screen, and near the inlet to the stacks H, has a balanced damper arranged to work automatically by the pressure of the steam. The ducts consist of matched and beaded stuff. The dampers have the obvious advantage of stopping the supply of fresh, cold air to the stacks as soon as the steam is cut off, and there is thus no danger of freezing of the radiators. Under each floor register, between it and the coil, is suspended a pan of galvanized iron, as a receptacle for any dirt that may drop through the grating. These pans can be removed for cleaning.

The steam main from the boilers to the buildings is 6 inches in diameter, underground, and has a branch with a reducing valve and by-pass. From it two 4-inch mains are taken to the two buildings.

The piping in both buildings is practically the same. The steam-supply pipes are shown by double lines in the illustrations, and are marked S, while the return pipes R are in full black. The steam mains, starting with a 4-inch diameter, continue along the basement ceilings, reducing gradually in size, as indicated, as branches are taken off for the various coils and radiators, to 2 inches at the far ends of the buildings. The return mains, in both cases, start at the left-hand ends, 1¼ inches in diameter, and also run along the basement ceiling, increasing gradually, as connections are made to them, to 2 inches at the other ends. From these ends the two main returns are brought back, retaining that size, and are joined in one 2½-inch pipe, which is carried to the boiler-room independently on the same line followed by the steam-supply pipe, and is trapped into a tank.

The steam and return mains from the boiler-house are carried in masonry trenches. At intervals of 200 feet along the line of these trenches are manholes of masonry with stone coping and cast-iron covers. Drainage of water from the trenches is secured by means of earthenware tile pipe in the bottom, with proper outlet connections.

Expansion joints are provided in the pipes at every 200 feet. Expansion of the mains in the buildings is allowed for by offsets, as shown. All the underground pipes are covered with asbestos cement, and all steam and return pipes in the buildings, above ¾-inch in diameter, are also provided with non-conducting covering.

The direct radiation consists of 1-inch wrought-iron pipe wall coils, and of Bundy loops.

ELECTRIC MOTORS.

(Continued from page 365.)

THE JENNEY MOTOR.

THE Jenney constant-potential motor, made by the Jenney Electric Motor Company, 218–224 South Illinois Street, Indianapolis, Ind., is shown in Fig. 25, page 382.

The motor differs considerably from those in general use. The pole pieces, it is claimed, are made to correspond with the natural curvature of the lines of force, thereby reducing to a minimum the length of the magnetic circuit and its resistance.

There is but a single field magnet, and in all sizes the core is made of soft wrought iron. No yokes are needed. The pole pieces are made of soft cast iron. The cores extend entirely through the pole pieces, which are bored to fit them accurately. The pole pieces are then slotted, and by means of bolts are firmly clamped to the core. By this means, it is claimed, the largest possible surface contact is secured, and a good magnetic union with a small amount of magnetic resistance.

The armature is of the drum type, and is built up of thin disks, all of which are securely fastened to the shaft. The winding is a modification of the Siemens method, and the armature is so proportioned that it has but little idle wire over the ends. The commutator is insulated with mica.

Self-oiling boxes are used on the machines. All motors above one horse-power are supplied with a double set of brushes, so that the brushes may be turned or changed without stopping the motor. All parts are made after fixed standards, and are interchangeable.

For convenience in starting and stopping the motor a rheostat is furnished to be included in the armature circuit. The switch should be placed so that when the motor is started all of the resistance is thrown in. This prevents an excessive flow of current into the armature, and allows the motor to start gradually. The motors are made from one-half horse-power up to 36 horse-power.

The company is now also preparing an arc motor for smaller capacities.

THE THOMSON-HOUSTON MOTOR.

THE motor made by the Thomson-Houston Motor Company, 620 Atlantic Avenue, Boston, Mass., is shown in Fig. 26.

All the motors are of one type, extremely simple in construction, and all parts are interchangeable. They are ordinarily shunt wound and are built for constant potential circuits of 110, 220 and 500 volts. The first two are intended for use in connection with the ordinary two and three wire systems of incandescent lighting, and the last one is for use on railway circuits, or for special purposes where power is transmitted over long distances or in units so large that a lower voltage would prove uneconomical. Special motors differing in type from the one here shown, or for other voltages, are built for special cases. By a simple shunt winding, properly proportioned, automatic regulation of speed of less than 2 per cent. variation is claimed to be obtained on all of the Thomson-Houston motors, no matter what the fluctuations of load may be. This feature permits simple construction of the motor, and at the same time secures an automatic regulation of speed well within the range of that which is guaranteed for the best regulated high speed steam engines.

The base frame is made of cast iron, and in all the machines is very heavy in proportion to the total weight. Up to, and including, Class 40, the yoke which joins the field magnets is an integral part of the bed-piece, the whole being made in one casting, and the seat for the field magnets afterwards planed down so as to secure a perfect fit between these and the bed-piece. Above Class 40 the yoke of the magnet does not form a part of the base frame, and in these machines the casting for the base is made with a cavity of sufficient size to receive the separate yoke-piece. The surfaces upon which the pillow blocks rest are planed down to a true face. The base frame is provided with projecting lugs, so that by means of lag screws the motor may be fastened to its foundation. Each motor is provided, whenever desired, with a supplementary base for tightening and loosening the belt.

The pillow blocks are made of cast iron and rest upon planed surfaces on the ends of the base frame, and are each fastened to it by four bolts, two of them being tapered and two straight.

The bearings are made of brass in all motors up to and including Class 30, and in the larger sizes are made of cast iron faced with babbitt, the cast iron being in the form of a sleeve with a spherical hub which has a seat, also spherical, made for it upon the top of the pillow block. Near the ends of the sleeve and on its upper side are cut two grooves entirely through the shell at right angles to the line of the shaft, and in these grooves upon the shaft rest two metal rings, which, at their lower side, pass beneath the sleeve and dip into small reservoirs of oil situated one upon each side of the spherical seat of the bearing. These reservoirs are made in the casting upon the top of the pillow block. As the shaft turns, the rings are set in motion and continually carry fresh oil from the tank to the upper surface of the shaft. The spherical hub of the sleeve resting in a hollow spherical seat provides for the maintenance of an accurate alignment of the bearings with the shaft.

The magnetic circuit is of the single horse-shoe form, with the arms of the magnet projecting upward. It consists of a yoke, two magnet cores, two pole pieces, and the armature core. The yoke is, in all machines up to and including Class 40, a part of the base, and is, therefore, made of cast iron. In larger sizes it is detachable from the base and is made of wrought iron. The cores and pole pieces are cast iron in all machines up to and including Class 30, and in these machines one core and its pole piece are cast in a single piece. Above Class 30 the cores are separate and are of wrought iron, the poles in all cases being made of cast iron.

The field coils are in all cases wound on spools or cylindrical shells of galvanized iron with brass heads. Double cotton covered copper wire is used, the bottom layers being thoroughly insulated from the core.

The armature of the Thomson-Houston motor may conveniently be described as made up of four parts—the shaft, the core, the commutator, and the winding. The shaft is made of steel, and in the smaller sizes of motors is of uniform diameter throughout, but in the larger motors has its largest diameter along its central part. Two rings are shrunk upon the shaft near the brass journals to prevent the end play of the armature damaging the commutator. The armature core, which is of the drum type, is made of thin circular plates of charcoal iron, insulated from each other by thin sheets of paper. These plates have a hole in the center through which the shaft of the armature passes, and three other holes through which bolts for clamping the plates together are passed.

The commutator is built with the utmost care as to its solidity, its thorough insulation and its durability. To secure solidity the bars are beveled at both ends and tightly clamped between suitable iron heads from which they are insulated by mica rings. The commutator bars are insulated from each other and from the iron core of the commutator by the same material. A modified Siemens winding is employed for the armature. Cotton-covered wire is used, and is insulated from the core with mica.

The motors are made in capacities ranging from 1 to 75 horse-power.

(TO BE CONTINUED.)

CITY ENGINEER JACKSON, of Boston, Mass., has prepared a plan for the abolition of all the grade crossings on the Providence Railroad in the city. It is the third plan that has been prepared for this purpose.

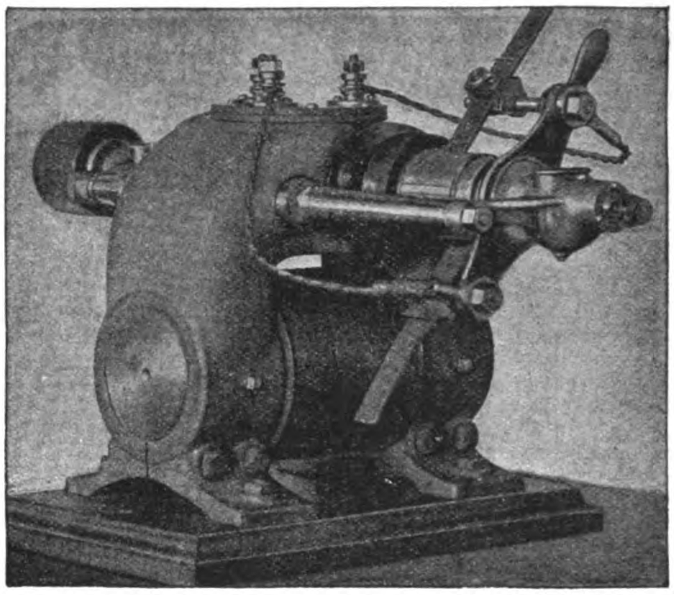

FIG. 25.—THE JENNEY MOTOR.

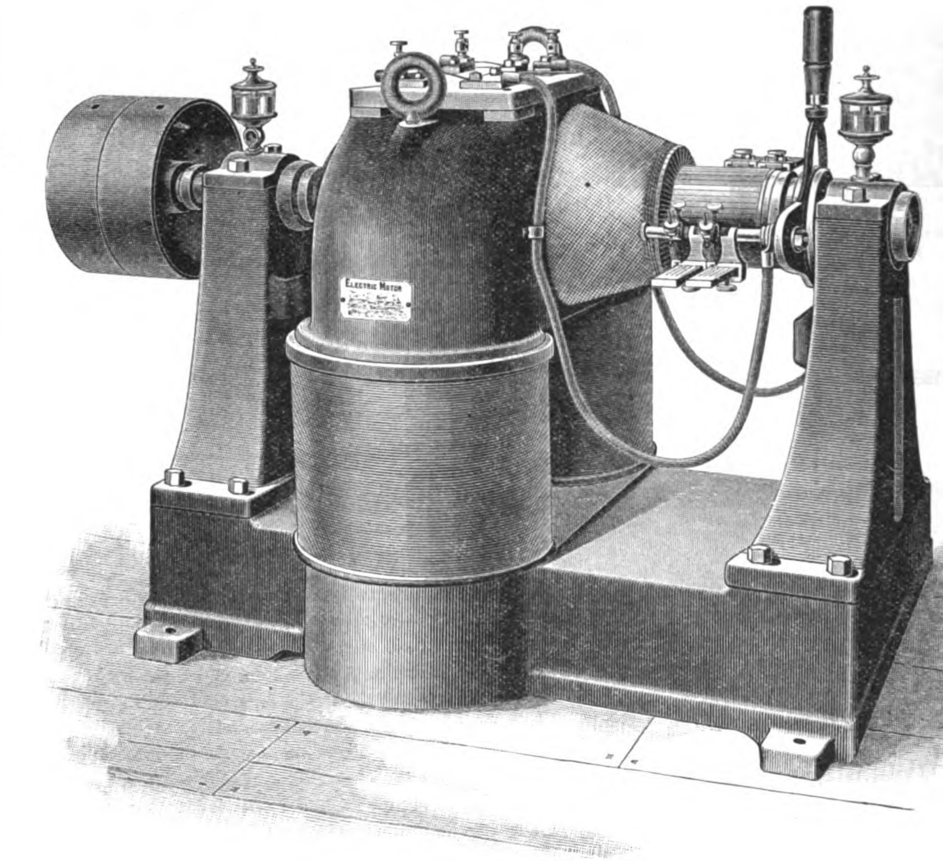

FIG. 26.—THE THOMSON-HOUSTON MOTOR.

FEEDING BOILERS WHEN SHORT OF WATER.

THE Manchester (England) Steam Users' Association has issued a report on a series of experiments made with a view of ascertaining the result of injecting feed-water into a boiler when the boiler is short of water, and the furnace is red-hot. It has for long been a common belief among engineers, that many boiler explosions are due to this cause; and to the same cause have been attributed accidents to domestic circulating boilers which have been allowed to run dry, and have then had cold feed-water admitted. The correctness of this belief has, however, for some time been doubted, and the elaborate series of experiments recorded in this report go to prove that it is altogether erroneous. As described in the *Journal of the Society of Arts*, London, a Lancashire boiler 27 feet long was fitted up for the purpose of the experiments, so that the condition which it was desired to investigate could be reproduced, while observations could be taken of what was going on within the boiler. These experiments were by no means free from danger, and an observatory had to be constructed near the boiler. As a result, it was found that the sudden injection of the cold feed did not cause a rapid generation of steam and a sudden violent pressure which the boiler in its weakened condition could not stand. In some cases, indeed, the pressure was slightly raised; but it always fell immediately afterwards, and in other cases the cold feed at once lowered the pressure. The writers of the report even think that it might be advantageous in cases where the water has been allowed to get very low, and the furnace-crowns to become heated, to turn on the feed, though they hesitate, in the present state of knowledge on the subject, to recommend such a proceeding.

THE work of replacing the car stove by a steam-heating system has been almost completed in the State of New York, where the car stove has been put under a legislative ban. In New England all the railways are rapidly abandoning the old system, and in Canada considerable progress in the same direction has been made. In the West and in the Middle States, however, but little has been done in this field during the past year.

THE MAINTENANCE AND OPERATION OF WATER-WORKS BY PRIVATE COMPANIES.

(Concluded from page 367.)

16. **Order Book.** Record No. 918.

Every order given for any kind of material or supplies must be made out on the Order Book, and a duplicate made on the stub before the order is torn off and sent.

When the material is received, it should be carefully examined and checked up by the bill, and, if found to be satisfactory enough to be kept and used, check the same on the stub of the Order Book, and enter the date it was received.

17. **Bills, Fixture Rates.** 12 inches long, 4¾ inches wide. Color, white. Record No. 915.

In filling out these bills, give the name of the owner and the location of the premises. If, by agreement, a tenant or agent is to pay the bill, then, after giving name of owner, say "in care of," and then give name of party who is to pay the bill, but unless there is special arrangement to the contrary all bills must be made out against the owner.

On the first line, in the right-hand column, enter the gross amount at the quarterly fixture rate, and then, on the lines below, give the details of the same, naming each fixture or use charged for, and the amount of the charge.

If the amount of the bill, or any special reason, entitles the party to a discount, give the amount of the same and then the "amount due."

When the bill is paid, fill in the date, both on the bill and on the stub, and sign the bill, all in the places provided.

18. **Bills, Meter Rates.** 12 inches long, 4¾ inches wide. Color, primrose. Record No. 916.

In filling out these bills, observe the same rules as in filling out bills for fixture rates, as far as names and location are concerned.

On the first line in the right-hand column give the minimum quarterly meter rate, charged in advance.

Then fill out the blanks, and carry out the amount to be charged for, which is the excess used above the amount charged for in the minimum rate.

If the meter read in "cubic feet," give the readings, but only transpose the "total amount used" into gallons.

Fill out the other lines as indicated, and, when the bill is paid, date and sign it.

There is no "discount" on "meter rents," but only on the charge for water. Consequently, the "discount" line is above that for "meter rent."

19. **Bills, Miscellaneous.** 12 inches long, 4¾ inches wide. Color, opaline. Record No. 917.

These bills are to be used for all service pipe work, including repairs on such work. The usual items that will be most often charged for are printed out in the bill, and blank spaces left for other charges.

In making out, receipting, and filling these bills follow the same general instructions as are given for fixture and meter bills.

20. **Gate Book.** 4 inches by 7 inches. 180 pages, numbered. Horizontal ruling 3 to the inch, with double red heading. Record No. 921.

Gates are any kind or size of gate or valve that is used on the pipes of the company, except corporation cocks, service and sidewalk stops, and air and pet cocks.

This book must be arranged by streets, alphabetically, leaving space enough between streets for future additions, extensions, or new streets.

In the front of the book, arrange an alphabetical index, giving the page on which each street commences.

Head the pages with the name of the street, and then, commencing at one end, enter in their proper order the location of every gate necessary to control that street, including main gates, gates to side streets, and blow-offs. This will cause most gates to be recorded twice, but will be found invaluable in attempting to "shut off" or "let on" a street.

In making entries, give first the size of the gate, then the maker's name, then the direction to turn to open, then the general location, and then the exact location by description and measurements. Add any remarks or details considered of value.

[EXAMPLE.]
Main Street.
16 inch. Chapman. Opens to the left.
South side of State Street.
Twenty-eight feet east of building line on Main Street.
On building line south side of State Street.

21. **Hydrant Book.** 4x7 inches. 180 pages. Horizontal ruling, three lines to the inch, with double red head lines. Pages numbered. Record No. 922.

Give each hydrant a number, arranging them in the most natural and consecutive order possible.

Enter the numbers in proper successive order, and give the necessary description and location of the same. As a large majority of all hydrants, if not all, on any one works, will be of the same size, make, and pattern, it will not be necessary to describe each separately, but give a description of such in the front of the book, and then enter all such as "standard," or other designating word. But, if any vary from this "standard," describe them in detail opposite their proper number.

If any hydrant is paid for by private parties, mark it "private." All others will be considered as being public—*i. e.*, erected by order of the municipality.

22. **Street Plan Book.** 22x30 inches. (Whatman's Imperial.) Record No. 923.

This should be a "book plan," made on a scale of 50 feet to an inch, which is sufficiently large to show all main pipes, gates, hydrants, specials, etc., and give the necessary dimensions and location measurements of the same.

The first sheet should contain an outline map of the city, town, or village in which the works are situated. This map should be divided into as many rectangular sections—each section numbered—as there are detail sheets in the book. This map will be on such scale as the size of the place will admit.

Each following sheet should contain that portion of the place which is indicated by its corresponding rectangle on the map, together with such extensions, etc., as may be useful in connecting one sheet with another. Each sheet should show streets, alleys, parks, etc., and such principal or public buildings as may be deemed best. If desired, all buildings of a reasonably permanent nature may be shown, always excepting sheds, small barns, etc.

On the streets, alleys, etc., should be shown, in their proper location, all mains, specials, gates, hydrants, blow-offs, air-valves, etc., with sizes and location measurements given.

All pipes, specials, gates, hydrants, etc., to be shown in full red lines, and all sizes indicated in red ink, while location measurements should be given in black.

Fill in the pipe system, and give all the details of the same before lettering the streets, etc., so that there may be no confusion between the two. The plans are made to show the pipe system, and this should take precedence over all else on the map.

If there is room, without crowding, and the information is at hand, it will be found convenient to put on the maps all street-car lines, sewers, gas-pipes, etc. When done, the sheets should be carefully bound and lettered. The "Boston office" will attend to this at any time.

23. **Maps.**

There should be a large bound map, made on cloth backed egg-shell paper, and mounted on a roll, showing all the streets, alleys, parks, public and principal buildings in the place, on which should be shown the pipe system and location of the works of the company. Whenever possible, make this on a scale of 200 feet to an inch.

Show the pipe system in red, using figures to indicate pipe sizes. Draw the line, representing the pipe, full across all street intersections or other places where there are specials, gates, hydrants, etc., so as to show the same clearly, but once on each block leave a short gap, or space, in the line in which to place the figures representing the size of the pipe.

There will be very few places where the pipe changes size, except at street corners and intersections; but, if it should, then the point will be indicated by the introduction of the reducing special, and the sizes of the pipe be given on each side of it.

It will not be necessary to give distances or other measurements on the map, as the book plan should furnish all details of that kind.

A smaller map, on a scale of 500 feet to an inch, should also be made for use on the work. The original should be kept in the office, corrected from time to time, and tracings made from it for pocket use. It should show streets, etc., and the entire pipe system, the same as the larger maps.

There should also be full and complete plans of all buildings, dams, reservoirs, foundations, machinery, etc., carefully drawn and preserved.

These should be of different scales, but on uniformed sized sheets, 30 inches long by 22 inches wide. Whatman's Imperial will be found best for this, and the sheets can be bound into the "book plan," if the latter is not too large. If it is they can then be bound separately.

24. **Vouchers or Bill Covers.** Color, lilac. Record No. 905.

All bills should be placed in one of these covers; and the same numbered consecutively, as they are entered in the Invoice Book.

The name and address of party rendering the bill, with its date and amount, all properly entered on the back.

When it is approved, the party or parties approving should indorse it, and indicate the different accounts to which it is to be charged, with the amount of each division.

25. **Trial Balance Sheets.** 13¼ inches long, 8 inches wide. Printed on distinctive tinted papers for different companies. Record Nos. 940 to 945, etc.

Fill out in the respective columns the "ledger page," "debit," or "credit balance," opposite the names of the different accounts which each company keeps.

The accounts are so arranged that those which will usually have a "debit balance" come together, and those which usually have a "credit balance" come together.

BOOK NOTICES.

Domestic Sanitary Drainage and Plumbing. By William R. Maguire. London: Kegan Paul, Trench, Trubner & Co., 1890.

This handsomely printed volume of 437 pages, contains a series of lectures given to plumbers and others at the Technical Institution in South Kensington, London, under the auspices of the City and Guilds of London Institute for the Advancement of Technical Education, and of the Worshipful Company of Plumbers, London. The author is a registered master plumber of 30 years' experience, and an associate of the Institution of Civil Engineers of Ireland.

The subjects treated of are the education of plumbers, elementary science for plumbers, sewage disposal, sewerage and drainage, sanitary plumbing, sanitary appliances, water supply, hot-water supply, plumbers' materials and plumbers' tools, and the work is illustrated with 283 wood cuts.

Taken as a whole, it affords an excellent view of the best methods of work in sanitary plumbing as now ordinarily practiced in England, and describes and illustrates the various fixtures, traps and tools in ordinary use. The author does not believe in the possibility of teaching young plumbers their handicraft from books, holding that "the only way to acquire the skill necessary for a journeyman is the way of the bench in the workshop, under the guidance of an experienced craftsman," but he also rightly holds that plumbers' apprentices must learn much more than can be acquired at the bench and on the job, before they can hope to become first-class journeymen.

Masters and foremen have not time to teach, and journeymen cannot be expected to teach possible competitors.

The chapter headed "Elementary Science for Plumbers" is an excellent one. The chapters on sanitary plumbing and sanitary appliances are full and well illustrated. No particular patents are advocated, and it does not appear that the author's own devices are patented. The direction that soil pipes should always be fixed outside the outer wall of a house, would not answer in this climate.

We commend the work to all practical plumbers, and especially to those who are learning the trade.

The Marquis of Tweeddale, speaking at the North British meeting, said the Forth Bridge is already earning almost enough to pay the full dividend on its cost, and that no fear need be entertained that the North British or any of the guaranteeing companies will be called upon to make up any deficiency under the guarantee. As an instance of the development of traffic since the opening of the bridge, he mentioned that the traffic between Edinburgh and Dumfermline and Kirkcaldy had increased 88 per cent.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

THE ENGINEERING AND BUILDING RECORD,
277 Pearl Street, New York.
November 15, 1890.

CONTRACTING INTELLIGENCE.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source

For works for which proposals are requested see also the "Proposal Columns," pages i-ii-385.

WATER.

For Additional Water Items see Proposal Columns.

ZANESVILLE, O.—John W. Hill, Consulting Engineer, Cincinnati, O., informs us that project for water-works improvement at this place was defeated last week at general election. It is expected that the question will be revived, with better results, during the winter.

STOCKTON, CAL.—The Blue Lakes Water Company will run its pipe line to this place to furnish water and power. Seventy five miles of pipe and a large reservoir will be required to perfect the project.

WHITESTONE, L. I.—The question of establishing a system of water-works at this place is to be decided by the taxpayers at a special election to be held November 20. The estimated cost of the plant desired is $35.000. For further particulars address C. B. Williams, Secretary of the Board of Water Commissioners, as above.

FOREST GROVE, ORE.—The Gales Peak Water Company, recently incorporated at this place, will expend the sum of $100,000 on a system of water-works. The towns of Cornelius and Hillsboro will also be supplied. For particulars address C. M. Keep, as above.

SAGINAW, MICH.—Several thousand feet of water main extensions are to be made in this city. For particulars address Mayor Weadock; as above.

ARKADELPHIA, ARK.—G. W. Carder, of this place, is advertising for bids for the construction of a system of water-works. For particulars see our Proposal Columns.

CRANFORD, N. J.—A system of water-works is to be established at this place by a newly organized company,

GRIFFIN, GA.—It is proposed to expend the sum of $75.000 on the projected system of water-works and electric lights at this place. For particulars address W. A. Robinson, as above.

WESTCHESTER, N. Y.—The New York and Westchester Water Company has been incorporated with a capital stock of $500.000. The company's sources of supply are intended to be from springs, streams, wells, and artesian wells, or other available sources of supply. The incorporators are John F. Hume, of Poughkeepsie, and others.

QUINCY, ILL.—The movement to establish a system of water-works at this place is rapidly maturing, and it is expected that important steps towards that end will soon be taken. An engineer is now making estimates regarding the probable cost of the undertaking, and a special meeting of the City Council will be held shortly to take decisive action.

KEITHSBURG, ILL.—J. L. Noble writes from here as follows· "The contract for water-works was not let; there will be nothing done before next March."

MADELIA, MINN.—C. C. Cooley, Recorder, writes: "In the spring we will put in water-works; $9.000 voted. High tank and water mains. Plans and specifications will be on file about 30 days."

CANTON, S. D.—A. A. Richardson, Consulting Engineer, of Lincoln, Neb., has finished plans for a system of water-works for this place, and bids are now wanted, to be opened December 1. For further particulars see our Proposal Columns.

COAL CREEK, COL.—City Clerk John Graham writes: "We are inviting bids for laying one mile of water mains, 3-inch iron pipe, with 10 hydrants, at stated points along the line; also, one circle reservoir, 50 feet in diameter, to be cemented, and all work guaranteed."

ST. PAUL, MINN.—The Red Rock Camp-meeting Association has awarded contract for artesian well to J. E. Cary, of West St. Paul.

LISBON FALLS, ME.—The taxpayers of this place propose to establish a system of water-works at once. For further particulars, address Hon. W. H. Newell, as above.

ROCHESTER, N. Y.—Several additional water mains are to be laid here. For particulars, address City Clerk Sheridan.

MISHAWAKA, IND.—City Clerk R. D. O. Smith writes: "Water-works to be established here by a local company in connection with town authorities. The system to become the property of the town upon repayment of investment. Pumps will be two compound condensing; capacity, 3,000,000 gallons. Town also owns water power, which may be utilized later. Water will be taken from 30-foot well. If weather permits pipes will be put in the ground this fall and water will be ready to run by March next."

ROCKFORD, IOWA.—Mayor C. Yorker writes, "Our water-works project has advanced so far as to insure you in publishing that we are ready to receive bids for the construction of the plant."

SORRENTO, ME.—Plans, etc., embracing five different schemes of piping, for a system of water works for this place have been submitted by the engineer, M. M. Tidd, of Boston, Mass., to the Frenchman's Bay Land and Water Company. Water will be taken from Long Pond, five miles distant.

FORT SMITH, ARK.—M. M. Tidd, C. E., of Boston, Mass., is preparing plans for additions, etc., to the water-works system of this place. Improvements are contemplated in the reservoir capacity, pumping machinery, etc.

WESTBORO, MASS.—Plans for a system of water-works for the Lyman school for boys are being prepared by the engineer, M. M. Tidd, of Boston, Mass. Water will be taken from Chauncey Pond and pumped into a stand-pipe to be located on the summit of the hill in the rear of the present school buildings.

YORKSHIRE CENTER, N. Y.—Town Clerk D. S. Churchill writes: "There has been some parties here from Stamford, N. Y., looking up the matter of water-works. I think there is a fair prospect of our getting some works in here either by parties who reside here or from outside parties."

JASPER, TENN.—County Clerk J. S. Drokehs writes: "There has been no definite steps taken for any water-works in our town. At Sequachee, Tenn., they contemplate erecting water-works soon. E. E. Smart, Sequachee, Tenn., is the general manager of the company."

PHILADELPHIA, PA.—The following bids for the construction of a reservoir were received by Louis Wagner, November 7: Filbert & Porter, Philadelphia, Pa., $665,945; John B. Riley, Langhorne, Pa., $500,000.

CINCINNATI, O.—The new B. C. A. will probably advertise for pumping machinery for the water-works very soon; 60,000,000 gallons capacity per day will be added to the present capacity.

KNOXVILLE, TENN.—The Board of Aldermen of West Knoxville, at a meeting held November 11, decided to suspend action in the water-works improvement matter, for a period of 30 days, during which time each of the parties now proposing to furnish water to the corporation will be allowed to lay before the Aldermen such testimony, etc., as they deem proper in favor of their individual plans. Alderman Smith can furnish particulars.

READERS of **THE ENGINEERING AND BUILDING RECORD** interested in the Contracting News Department of that paper are respectfully requested to examine those columns every week, and advise the Editor of any item which they may find that, in their judgment, is of no value to any one other than the person mentioned.

ATLANTA, GA.—The award of the contract to the Howard-Harrison Iron Company, of Bessemer, Ala., voted on November 4, has been postponed, pending an opinion regarding the legality of the bonds recently voted for the projected water-works improvement.

WATERBURY, CONN.—The question of increasing the water supply of this place is still under discussion by the local officials, though no definite plan of action appears to have been agreed upon. The City Clerk can furnish particulars.

ROCKAWAY, L. I.—The Queens County Water Company, whose stand-pipe is now 100 feet high, proposes adding 50 feet to its height in order to secure a greater volume of water, and give additional force in distributing it through the mains.

WATER WORKS.—See our proposal columns for information regarding water-works and water-works furnishings at the following places: Harrison, O.; Ballinger, Tex.; Canton, S. D.; Arkadelphia, Ark.; Toronto, Ont.

SEWERAGE.

For Additional Sewerage Items see Proposal Columns

CORDELE, GA.—Mayor G. M. McMillan writes: "An election for or against issuing bonds for sewerage system will be held November 27."

ROCHESTER, N. Y.—Numerous important sewer extensions are to be made in this city. Address City Clerk Sheridan for details.

SALEM, MASS.—It is proposed to expend the sum of $4.400 for establishing sewers in the Fourth Ward of this city. The City Clerk can furnish particulars.

BRISTOL, CONN.—The officials at this place are agitating the question of an improved system of sewers. The scheme proposed, approved by the State Board of Health, is to carry the sewerage through an 18 inch pipe to a tract of 10 acres, a mile and a half from the town, where it can be disposed of by filtration, the land having a depth of about 10 feet of fine gravel.

MANCHESTER, VA.—The question of establishing a system of sewers is being discussed by the officials of this place. Address the Town Clerk for details.

PITTSBURG, PA.—It is proposed to improve the sewerage system of the south side of the city. For particulars address Dr. G. B. Sweeney, as above.

ATLANTA, GA.—The project to extend the sewerage system of this city, at an estimated cost of $95,000, has been postponed indefinately.

SEWERS.—See our Proposal Columns for information regarding sewer construction at the following places: Poughkeepsie, N. Y.; Victoria, B. C.; Suspension Bridge, N. Y., Rockford, Ill ; Denver, Col.

BRIDGES AND IRON STRUCTURES.

For Additional Bridge Items see Proposals Columns.

ALEXANDRIA, LA.—It is probable that immediate steps will be taken towards the construction of the projected bridge over the Red River, at this place.

SIOUX CITY, IA.—City Engineer Wingeland has submitted his report regarding the viaduct to be erected over the railroad tracks, at lower Fourth Street. The cost is estimated at $80.000, and the matter is to be further considered at a later meeting.

GREENVILLE, MASS.—Reports say that a bridge is to be erected over Little Trail Lake, at this place.

VICTORIA, B. C.—The City Council has authorized that necessary repairs be made to the Rock Bay drawbridge. For particulars, address Mayor Grant, as above.

SCRANTON, PA.—The City Engineer has been directed to prepare plans, specifications, and an estimate of cost for an iron bridge across Beach Creek.

UTICA, N. Y.—Superintendent Hannan has inspected the Genessee Street Bridge, and states that it will have to be removed and a new structure take its place. He has therefore authorized the making of plans, etc., for the proposed new bridge, which are to be submitted to him, after which the work of construction will be undertaken.

SPOKANE FALLS, WASH.—The following proposals for the construction of the Monroe Street bridge were opened November 5 by the City Council: Wrought Iron Bridge Company, of Canton, O., $113,300; San Francisco Bridge Company, $118,500; Smith Bridge Company, of Toledo, O., $124.450; Hoffman & Bates, Portland, Ore., $125.000; King Iron Bridge and Manufacturing Company, Cleveland, $125,800; Pacific Bridge Company, Portland, Ore., $121,000; Chicago Bridge and Iron Company, $114,000; Milwaukee Bridge and Iron Works, $114.867; The latter company presented a design of their own, which they offered to build for $111,000. All the bids were referred to the City Engineer, with instructions to examine and report as soon as possible to the Council. The contract for furnishing the stone to be used in the bridge was awarded to Andrew Conburg, at $124 per cubic foot for cut stone.

PHILADELPHIA, PA.—A sub-committee of the Councils' Survey Committee, on November 10, conferred with Chief Engineer Nichols, of the Philadelphia and Reading Railroad Company; Chief Engineer Brown, of the Pennsylvania Railroad, and other railroad officials, with reference to several ordinances introduced in Councils and approved by the Board of Surveyors for bridges at various places. One of the ordinances provides for the construction of a bridge over the Chestnut Hill branch of the Reading Road at Graver's Lane. In reference to an ordinance for a bridge on the line of the Connecting Railroad at Seventeenth Street, which is said to be necessary to carry out the plan of grades lately revised by the Bureau of Surveys, Engineer Brown said that such a structure would cost about $61,000, and he did not think the company would erect a bridge, as the railroad was constructed before the street was placed on the city plan. The company, he said, was ready to bridge Margaretta. Bridge and several other streets on the New York Division, to avoid grade crossings, and was only waiting for the city to act in the matter. In regard to an ordinance for a bridge over the Reading Road on the line of Seventeenth Street, Engineer Nichols said the cost would be about $55,000, and that he would lay the subject before the officers of the company. Several ordinances for bridges over Collom and other streets, in the Twenty-second Ward, were also discussed, but no action was taken.

MACON, GA.—At a meeting of the Bibb County Commissioners it was ordered that a bridge be erected over the Vineville branch, at the foot of Jefferson Street, this city. Judge Miller can furnish particulars.

AUBURN, ME.—It has been suggested by several taxpayers of this place that a bridge is necessary over the Androscoggin, at Boxer's Island. The City Clerk can probably furnish particulars.

AUGUSTA, GA.—The Charlotte, Columbia and Augusta Railroad Co.'s wooden bridge over the Savannah River, at this place, is to be replaced by an iron structure. For particulars address E. W. Scott, Bridge Foreman, Richmond and Danville Railroad, as above

TORONTO, CAN.—The City Engineer has completed the plans for the proposed high level bridge over the Don at King Street, and it is probable that proposals will soon be wanted.

TOPEKA, KAN.—Our correspondent writes: "The proposition submitted at the November election to build a bridge across the Kansas River, in this city, on Quincy Street, to cost $100,000, was carried by about 3,000 majority."

MONTREAL, CAN.—An appropriation is to be made for having surveys, etc., prepared for a new bridge in this city, the particulars of which can be procured by addressing Alderman Prefontaine, as above.

COLUMBUS, O.—The plans for a viaduct at the High Street crossing, presented to the Board of Public Works November 9, by the various railroads, have all been rejected.

BRIDGES.—See our Proposal Columns for information regarding bridge construction at the following places: Sheboygan, Wis.; Hamilton County, O.

NEW DEPOTS.

Orwigsburg, Pa.—The Valley Railroad is about to erect additional buildings at this place.

Ashville, Ala.—The Ashville Railroad Company is about to erect a new depot at this place.

GAS AND ELECTRICITY.

Indianapolis, Ind.—The question of public lighting for this city still remains unsettled. The Mayor can furnish particulars.

Utica, N. Y.—The Common Council has contracted with the Utica Electric Light Company to light the public streets, etc., for a term of three years, at the rate of 35 cents per light per night for 400 lights.

Ashbourne, Pa.—An electric lighting plant is to be established at this place.

East Liverpool, O.—A system of electric lights is to be established at this place in the near future. For particulars, address Mr. McKeehan, as above.

Elgin, Ill.—Another electric light company has been organized at this place and a franchise is to be asked for. Address Alderman Joslyn for details.

Louisville, Ky.—Mayor Jacob has awarded the contract for lighting the streets, etc., of this city, to the Louisville Gas Company, at $66 per light per annum, for 150 electric lights.

Charleston, S. C.—The Charleston Electric Light and Power Company has decided to make extensive improvements to its plant, including the addition of considerable machinery.

Stamford, Conn.—Extensive alterations are to be made to the electric lighting plant at this place. The Borough Clerk can furnish particulars.

Electric Railways.—New electric railways are projected, and improvements are to be made to those already established, at the following places: Bridgeport, Conn.; New Bedford, Mass.; Schenectady, N. Y.; Ottawa, Ont.; Saratoga, N. Y.; Methuen, Mass.; Jamestown, N. Y.; Spokane Falls, Wash.

STREET-WORK AND PAVING.

Meriden, Conn.—The Street Committee of the City Council has authorized the improvement of several streets of this place.

Philadelphia, Pa.—The improvement of numerous business streets in this city is contemplated. Address the City Engineer for particulars.

Trenton, N. J.—There is a project being discussed here regarding the paving of several streets, the details of which can be had by addressing the City Clerk.

Grand Rapids, Mich.—The City Council has authorized the improvement of several streets of this place.

Toronto, Ont.—Considerable street paving is about to be commenced in this city. For particulars address Robert Jaffray, as above.

INDUSTRIAL.

Plainfield, N. J.—The Plainfield Common Council has adopted a resolution which calls for bids for the establishment of an electric railroad system. These propositions must be entered before November 24, when decisive action for rapid transit will undoubtedly be taken.

Delano, Cal.—The Kern and Tulare irrigation district, embracing 20,000 acres in the northern part of Kern and the southern part of Tulare County, voted, November 1, for the issuance of bonds in the amount of $700,000 for the construction of a canal from Kern River and laterals.

The Detroit Heating and Lighting Company has the contract for heating by hot water St. Anthony's Hospital of the Sisters of the Poor, at Columbus, O. The new extra large Bolton heaters will be used, and there will be about 15,000 feet of radiation.

BIDS OPENED.

Brooklyn, N. Y.—The following proposals for heating and ventilating in public schools Numbers 27, 31 and 36 were opened by the Board of Education November 11: In public school No. 27—The H. B. Smith Co., $2,785; William Blake & Co., $2,065; E. Rutzler & Co., $2,255; Philip Doup & Co., $2,173. In public school No. 31—E. Rutzler & Co., $7,596, Blake & Williams, $6,593; Philip Doup & Co., $7,331. In public school No. 36—E. Rutzler & Co., $6,392; Blake & Williams, $5,690; Philip Doup & Co., $6,354. The bids were referred to the Committee on Heating and Ventilating.

San Francisco, Cal.—The following proposals for the erection of the girls' new high school in this city, have been opened. For the building itself: John Butler, $86,770; J. H. McKay, $89,000; Thomas H. Day, $82,760; Shain & Hoffman, $92,300; J. P. McCormick, $74,521; J. W. Smith, $77,245; Riley & Doane, $88,490; McGowan & Butler, $86,770; J. J. Konrad, $89,400; J. R. Whalen, $87,423; S. T. Green, $84,473; Richard McCann, $90,000. The bids for plumbing, gas fitting, etc., were: H. Williamson, $3,924; Peter A. Kerrigan, $4,175; William F Wilson, $3,980; J. Dougherty, $4,495; Fritz & Kean, $3,900. The bids for heating, painting, tinning, etc., were as follows: Harney Heating Company, heating, $12,550; M. J. & J. J. Donovan, painting, $695; J. N. Sinlinger, painting, $1,950; William Winter, painting, $550; William Cronin, slating, tinning, iron work, etc., $10,090; Conlin & Roberts, slate, tin and galvanized iron work, $10,240; W. B. Glen, tinning, slating and iron work, $7,800.

GOVERNMENT WORK.

Washington, D. C.—The following proposals for the work specified were opened on the given dates by the Supervising Architect of the Treasury Department:

Louisville, Ky.—Approaches to the United States Court House and Post-Office. Opened November 11. Bidders: Owen Patterson, Baltimore, Md., Joliet limestone and Ohio sandstone, $39,950.50; Martin Hendricks, Washington, D. C., Wakefield granite, $37,352; Baltz & Kreles, Louisville, Ky., Granby, S. C., granite, $41,565; Virginia granite, $37,295.

Lancaster, Pa.—Erection and completion, except heating, of the United States Court House and Post-Office. Opened November 6. Bidders: W. Gray & Sons, Philadelphia, Pa., $84,587, Bedford oolitic; $89,635, Hummelstown; $92,789, Lee marble. John A. Bergen & Sons, Lancaster, Pa., $82,573, Indiana limestone. B. Donavan & Johnson, Allegheny, Pa., $111,600, Bedford. E. F. Gobel, Chicago, Ill., $86,396, Ohio bluestone; $87,096, buff Bedford; $91,396, Prentice brown stone. E. J. Bell, Portland, $96,000, Connecticut brown stone. J. E. & A. L. Pennock, Portland, $85,694, Indiana limestone. Lean Planing Mills Co., $93,896, Indiana limestone; $91,896, Ohio buff. Henry Shenk, Erie, Pa., $90,345, buff Amherst; $88,745, blue Amherst; $92,945, Indiana limestone. McLaughlin & Gessel, Lancaster, Pa., $77,915, Indiana or Ohio limestone. Geo. W. Corbett, Washington, D. C., $83,792, Indiana limestone. Robert S. Johnson, Trenton, N. J., $69,825, Indiana limestone; $75,000, Pennsylvania blue marble. Peter Pitken & Son, Rochester, N. Y., $78,000, buff Amherst; $76,240, Prentice brownstone; $75,505, buff Bedford. L. L. Leach & Son, Chicago, Ill., $80,755, Prentice brownstone. Justin McCarthy, Washington, D. C., $83,477.23, Ohio or Indiana buff Amherst.

PROPOSALS.

(Continued from page ii.)

REMOVAL OF SHOALS BETWEEN SISTER Islands and Cross-over Light, Saint Lawrence River, New York.—U. S. Engineer Office, Burlington, Vt., November 8, 1890.—Sealed proposals, in duplicate, addressed to the undersigned, will be received at this office until 11:30 A. M., December 9, 1890, and then publicly opened, for blasting and removing 247 cubic yards of rock, more or less, from two **SHOALS** between Sister Island and Cross-over Light, Saint Lawrence River, N. Y. Attention is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. Detailed information can be had on application. M. B. ADAMS, Major of Engineers. 23-24-1

BREAKWATER AT NEW HAVEN, CONN.—Engineer Office, U. S. Army, Room 74, Army Building, 39 Whitehall Street, New York, November 1, 1890.—Sealed proposals, in triplicate, for construction of a breakwater at NEW HAVEN, CONN., will be received at this office until twelve (12) o'clock noon, on TUESDAY, December 2, 1890. The attention of bidders is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. Further information can be obtained at this office. D. C. HOUSTON, Colonel of Engineers. 25

U. S. ENGINEER OFFICE, CHARLESTON-Kanawha, W. Va., November 3, 1890.—Proposals for building the **FOUNDATIONS**, and the pier, abutment, etc., for a movable dam at lock No. 8 of the great KANAWHA RIVER improvement, will be received at this office until 3 P. M. of December 19, 1890 and then opened. The attention of bidders is called to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. Information can be obtained by application to ADDISON M. SCOTT, Resident Engineer. WM. P. CRAIGHILL, Colonel of Engineers, U. S. A. 1

PROPOSALS.

PROPOSALS FOR DREDGING AND PIER WORK.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 6, 1890, and then opened, for **DREDGING**, and for repairs to breakwater at GRAND MARAIS, MINN. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 26

OFFICE CONSTRUCTING QUARTERMASTER, Fort Thomas, Ky., October 27, 1890.—Sealed proposals, in triplicate, subject to usual conditions, will be received at office of Constructing Quartermaster, U. S. A., FORT THOMAS, KY., until 11 A. M., November 27, 1890, and then opened, for construction there, of a **HOSPITAL** and hospital steward's quarters, and for the steam heating apparatus for the hospital, and for the plumbing of each building. The United States reserves the right to reject any or all bids, or parts thereof. Plans and specifications to be seen at this office, with full instructions as to bidding. Envelopes containing proposals should be marked, "Proposals for Hospitals, etc.," and addressed to 1st Lieutenant R. B. TURNER, 6th Inf'try, A. A. Q. M., U.S.A.

U. S. ENGINEER OFFICE, ROOM 62, ARMY Building, New York, October 15, 1890.—Sealed proposals, in triplicate, will be received at this office until 12 o'clock, noon, WEDNESDAY, November 19, 1890, for the following work: I. For the construction of new DIKES; II., for rebuilding and repairing existing dikes; III., for dredging in the Hudson River between New Baltimore and Troy, N. Y. Amount available, $105,000. The attention of bidders is invited to Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large, and the River and Harbor Act of September 19, 1890, Sections 6 to 12. For specifications, blank forms, and all information, apply to the undersigned. G. L. GILLESPIE, Lieut.-Col. of Engineers. 24

PROPOSALS FOR CONSTRUCTION OF Breakwater at Rockland, Maine.—United States Engineer Office, Portland, Maine, November 11, 1890.—Sealed proposals, in triplicate, for construction of **BREAKWATER** at ROCKLAND, MAINE, will be received at this office, No. 537 Congress Street, until 3 P. M. of TUESDAY, December 2, 1890, and then opened. Attention is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. All necessary information furnished by JARED A. SMITH, Lieut.-Col., Corps of Engineers, U. S. Army. 26

PROPOSALS FOR HARBOR IMPROVEMENTS.—United States Engineer Office, No. 366 Milwaukee St., Milwaukee, October 27, 1890.—Sealed proposals, in triplicate, will be received at this office until 12 o'clock, noon, November 25, 1890, and opened immediately thereafter in the presence of bidders for the following harbor improvements: Menominee River, Mich. and Wis., dredging about 200,000 cubic yards; Green Bay Harbor, Wis., dredging about 36,000 cubic yards; Kewaunee Harbor, Wis., pier extension 300 feet, more or less; Manitowoc Harbor, Wis., pier superstructure 600 feet, more or less; Sheboygan Harbor, Wis., pier extension 150 feet, more or less; Harbor of Refuge, Milwaukee Bay, Wis., breakwater extension and superstructure 400 feet, more or less; Racine Harbor, Wis., pier extension 200 feet, more or less; Kenosha Harbor, Wis., pier extension 150 feet, more or less. The attention of bidders is invited to the Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. Proposals will be accompanied by a guarantee that if the bid is accepted contract will be entered into within ten days after notice of acceptance. Preference will be given to materials and plant of domestic production and manufacture, conditions of quality and price (import duties included) being equal. For blank proposals and information apply at this office. The United States reserves the right to reject any or all bids. Proposals will be indorsed on the envelope, "Proposals for Menominee River, Mich. and Wis.," or "Proposals for .... Harbor," and addressed to Major CHAS. E. L. B. DAVIS, Corps of Engineers, U. S. Army. 25

PROPOSALS FOR DREDGING.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 6, 1890, and then opened, for **DREDGING** in the harbor of DULUTH, MINN., on west side of Rice's Point. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 26

U. S. ENGINEER OFFICE, BURLINGTON, Vt., November 13, 1890.—Sealed proposals, in duplicate, addressed to the undersigned, will be received at this office until 11:30 o'clock, A. M., December 15, 1890, and then publicly opened, for furnishing 1,610 cubic yards of rubble stone, 1,783 cubic yards of large stone (one to three tons weight), and completing the continuation of 135 linear feet of extension to the **BREAKWATER** at GORDON'S LANDING, LAKE CHAMPLAIN, VERMONT. Attention is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. Detailed information can be had on application. M. B. ADAMS, Major of Engineers. 24-25-2

PROPOSALS.

PROPOSALS FOR BREAKWATER.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 17, 1890, and then opened, for constructing 240 linear feet of **BREAKWATER** at MARQUETTE, MICHIGAN. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 1

U. S. ENGINEER OFFICE, BURLINGTON, Vt., November 8, 1890.—Sealed proposals, in duplicate, addressed to the undersigned, will be received at this office until 11:30 A. M., December 9, 1890, and then publicly opened, for furnishing 182,886 feet, b. m., of hemlock timber; 9,600 feet, b. m., of white pine timber; 3,000 cubic yards of rubble stone; 7,750 cubic yards of large stone, 1 to 5 tons weight; 1,208 pounds of screw and washer bolts; 546 pounds of ring bolts; 23,441 pounds of drift bolts, and constructing 300 linear feet of extension and repairing 1,225 linear feet of old superstructure to the **BREAKWATER** at Plattsburgh Harbor, New York. Preference will be given to materials of domestic manufacture or production, conditions of quality and price (import duty included) being equal. Attention is invited to the acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. Detailed information can be had on application. M. B. ADAMS, Major of Engineers. 23-24-1

November 6, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 4th day of December, 1890, for all the **LABOR AND MATERIAL** required for the excavation, concrete foundations, stone and brickwork of the basement and area walls, first floor iron beams and girders and columns in basement, for the U. S. Court-House, Post-Office and Custom-House building at BAY CITY, MICHIGAN, in accordance with the drawings and specification, copies of which may be had at this office or the office of the Superintendent at Bay City, Mich. Each bid must be accompanied by a certified check for $200. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked "Proposal for the Excavation, Concrete Foundations, Stone and Brickwork and Ironwork for the Basement and Area Walls for the U. S. Court-House, Post-Office and Custom-House at Bay City, Mich.," and addressed to JAS. H. WINDRIM, Supervising Architect. 24

November 5, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M. on the 3d day of December, 1890, for furnishing all **LABOR AND MATERIALS** required for the erection and completion (except heating apparatus and approaches), of the U. S. Court-House and Post-Office building at HELENA, ARKANSAS, in accordance with the drawings and specification, copies of which may be had on application to this office or at the office of the Superintendent at Helena, Arkansas. Each bid must be accompanied by a certified check for $500. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Erection and Completion of the U. S. Court-House and Post-Office building at Helena, Arkansas," and addressed to JAS. H WINDRIM, Supervising Architect. 24

November 10, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 29th day of November, 1890, for all the **LABOR AND MATERIALS** and fixing in place, complete, the low-pressure, steam heating and ventilating apparatus for the U. S. Post-Office, etc., building at HOUSTON, TEX., in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Houston, Texas. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, all bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Low-Pressure, Steam Heating and Ventilating Apparatus for the U. S. Post-Office, etc., building at Houston, Texas," and addressed to JAS. H. WINDRIM, Supervising Architect. 25

November 10, 1800.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect of the Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 2d day of December, 1890, for all the **LABOR AND MATERIALS** required to put in place, complete, the iron vault and closet doors for the U. S. Court-House and Post-Office building at PITTSBURG, PA., in accordance with the drawings and specification, copies of which may be had at this office, or the office of the Superintendent at Pittsburg, Pa. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for Vault Doors at Pittsburg, Pa.," and addressed to JAS. H. WINDRIM, Supervising Architect. 25

PROPOSALS.

U. S. ENGINEER OFFICE, WILMINGTON, N. C., November 6, 1890.—Sealed proposals for **DREDGING** in the harbor at BEAUFORT, N. C.; Waterway between Beaufort Harbor and New River, N. C., and New River, N. C., will be received at this office until 12 M, December 16, 1890. The attention of bidders is specially invited to Acts of Congress approved 26th of February, 1885, and 23d February, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. All information furnished by W. H. BIXBY, Capt of Engineers. 1

NOVEMBER 11, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 29th day of November, 1890, for all the **LABOR AND MATERIAL**, and fixing in place, complete, the low-pressure, return circulation, steam heating and ventilating apparatus for the U. S. Court-House, Post-Office, etc., building at HUNTSVILLE ALABAMA, in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Custodian at Huntsville, Alabama. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked, "Proposal for the Low Pressure, Return Circulation, Steam Heating and Ventilating Apparatus for the U. S. Court-House, Post-Office, etc., building at Huntsville, Ala.," and addressed to JAS. H. WINDRIM, Supervising Architect. 25

U. S. ENGINEER OFFICE, BURLINGTON, Vt.. October 24, 1890.—Sealed proposals, in duplicate, addressed to the undersigned, will be received at this office until 11.30 o'clock A. M., November 24, 1890, and then publicly opened, for furnishing 9,000 cubic yards of **RUBBLE STONE**; 2,112 cubic yards of large stone, 1 to 3 tons weight, and constructing 200 linear feet of extension to the breakwater at ROUSE'S POINT, LAKE CHAMPLAIN, N.Y. Attention is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol, 23, page 332, and Vol 24, page 414, Statutes at Large. Detailed information can be had on application M. B. ADAMS, Major of Engineers. 21-22-24

WATER-WORKS, Canton, S. D.—Proposals are wanted until December 1, for the construction of a system of water-works at this place. Address A. A. Richardson, C. E., Lincoln, Neb.

WATER-WORKS, Arkadelphia, Ark.—Proposals are wanted, no date specified, for the construction of a system of water-works at this place. Address G W. Carder, as above.

SEWERS, Rockford, Ill.—Proposals are wanted until November 29, for the construction of certain sewers in this city Address E. K. Conkling, City Clerk, as above.

PUMPING MACHINERY, Toronto, Ont.—Proposals are wanted until December 3, for furnishing a vertical pumping engine. Address J. D. Cook, Consulting Engineer, Toledo, O.

ELECTRIC LIGHTING, Harrison, O.—Proposals are wanted until December 2, for the construction of an electric lighting plant at this place. Address Mayor J. A. Graft, as above.

PIER, Ottawa, Ont.—Proposals are wanted until November 27, for the construction of a landing pier at Beaverton. Address A. Gobeil, Secretary Department of Public Works, as above.

DREDGING, Chicago, Ill.—Proposals are wanted until November 19, for doing certain dredging. Address Captain W. L. Marshall, U. S. A., as above.

LEVEES, New Orleans, La.—Proposals are wanted until November 20, for the construction of certain levees. Address Lieut. John Mills, U. S. A., as above.

SEWER, Denver, Col.—Proposals are wanted until November 25, for constructing certain sewers. Address F. B. Crocker, as above.

STREET WORK, Brooklyn, N. Y.—Proposals are wanted until November 17, for paving certain streets. Address John P. Adams, as above.

ELECTRIC LIGHTING, Little Falls, N. Y.—Proposals are wanted until November 21, for lighting the streets of this place by electricity. Address the Electric Light Committee, as above.

WATER-WORKS, Rockford, Iowa.—Proposals are wanted, no date specified, for the construction of a complete system of water-works at this place. Address Mayor C. Yorker, as above.

PAVING, Trenton, N. J.—Proposals are wanted until November 25, for paving certain streets of this city. Address Jno. C. Owens, City Clerk, as above.

BRIDGE, Murphy, N. C.—Proposals are wanted, no date specified, for the construction of a bridge over Brasstown Creek at this place. Address the County Commissioners, as above.

DREDGING, New York City.—Proposals are wanted until November 21, for dredging for proposed bulkhead wall at East One Hundred and Second Street Section, on the Harlem River. Address the Department of Docks, Pier A, North River, as above.

PIER, New York City.—Proposals are wanted until November 19, for doing certain work on the city piers. Address the Department of Docks, Pier A, North River, as above.

STREET WORK. Brooklyn, N. Y.—Proposals are wanted until November 24, for the improvement of certain streets of this city. Address John P. Adams, Commissioner of City Works, as above.

DREDGING, ETC., New York City.—Proposals are wanted until November 21, for preparing for and building a new crib bulkhead at Charity Hospital, Blackwell's Island, East River, and for removing the existing platform and crib bulkhead thereat. Address the Department of Docks, Pier A, North River, as above.

POSITIONS WANTED.

TOO LATE FOR CLASSIFICATION.

WANTED.—A POSITION AS ENGINEER BY a man with 14 years' experience in the shop and in the care of pumping and marine engines; best reference. Address JNO. B. NORRIS, P. O. Box 633, Huntington, W. Va.

MECHANICAL ENGINEER, 12 YEARS' EXperience, familiar with all branches of locomotive and machine construction, accustomed to managing men and supervising structural work, desires engagement; first-class references. Address G. A. H., care THE ENGINEERING AND BUILDING RECORD, 1050 Drexel Building, Philadelphia.

SPECIAL OFFERS.

DOUBTLESS many of our subscribers have a friend or friends who think of subscribing to THE ENGINEERING AND BUILDING RECORD for the coming year, and as every paper, however successful it may be, desires to increase the number of its subscribers, the following offers are made, to hold good during October, November and December, 1890:

Any present subscriber can have his subscription extended one year by sending:

One Renewal and One New Subscription..$7.25
" " " Two " " ..10.00
" " " Three " " ..13.00
" " " Four " " ..16.00

The new subscribers will receive, free of charge, the remaining issues of 1890, that is, those which appear after the order is received.

THE ENGINEERING AND BUILDING RECORD,
P. O. Box 3037. 277 Pearl Street, New York.

IMPROVEMENT OF INLAND NAVIGATION.

THE advent of railroads, some sixty years ago, acted not only to prevent any further extension of the system of canals and river navigation, which had made much progress in the early years of the century in this country, considering its moderate amount of wealth and population, but also to cause the abandonment of many canals that had already been constructed. In recent years the United States Government has expended considerable amounts in the improvement of natural water-courses, which have operated to increase, quickly and largely, the commerce of the districts adjacent to them The opposition frequently manifested, however, by influential newspapers of the country, has unfortunately caused, or been the main factor in causing, at different times the entire failure of the annual River and Harbor Bill, or such a diminution of the amount of the appropriations as to cause long delays in greatly needed improvements, sacrificing, by intermittent or insufficient appropriations for specific objects, considerable of the work already done, and increasing materially their final cost.

Public attention abroad has recently been more fully awakened to the desirability of increasing the facilities for internal water transportation, from its greater economy, especially for heavy or bulky articles of little value, and from its usefulness in acting as a check on the overcharges of railroads. It resulted in the holding of an International Canal Congress for the discussion of, and dissemination of information upon, this important subject, at Manchester, England, in July last. It was composed of delegates from all the principal countries of Europe, many of them holding official positions. Col. William E. Merrill, of the U. S. Corps of Engineers, who also attended the Congress by order of the War Department, on his return submitted a valuable report, showing what has been accomplished in France, and comparing it with the little progress yet made in this country. Extracts from this report are given elsewhere in this issue.

France, it appears, with an area of about 204,000 square miles (but little over three-quarters of that of Texas), has 3,000 miles of canals and 2,050 miles of canalized rivers, in addition to 1,850 miles of open rivers that are navigable. Of this extensive system only 355 miles of canal and 46½ miles of river, conceded to private companies, are subject to toll. Between 1814 and 1887 the French Government has spent nearly $266,000,000 on the improvement of its rivers and construction of canals; and since 1761, when its sea-ports began to receive real attention from the Government, over $233,000,000 have been expended on its harbors. Authorized harbor constructions require nearly $45,000,000 more for their completion. Of the above amounts nearly $92,000,000 have been expended for harbors, and $87,000,000 for rivers and canals since the Franco-German War, notwithstanding the great strain upon the finances of the country produced by the losses in that war and the large war indemnity that had to be paid to Germany. France, by her liberal expenditures, shows that it at least appreciates the value to its commerce of good harbors and cheap inland water navigation.

In England, much less attention has been paid during the last half century to inland water communications. Very little addition has been made, till recently, to the canals and canalized rivers existing before the railroad era, which are being held in short sections by different companies without consolidation. Many connecting pieces have been secured by the railroads themselves, thus making their improvement or competition with the railroads exceedingly difficult. There are about 3,813 miles of inland navigation in the United Kingdom, of which 2,644 miles are in England and Wales; and of the latter amount 1,225½ miles are owned or controlled by railway companies.

But the magnificent waterway so nearly completed from Manchester to tide water, and the projected canals for sea-going vessels from Birmingham to navigable water in the Mersey, and from the Forth to the Clyde in Scotland (expected to yield an annual traffic of six million tons), with the interest shown in this recent International Canal Congress, indicate an intention to make up for the neglect of the past.

In our country the strong interest now being shown, both at Pittsburg and in the Lake regions, in the construction of a canal from the Ohio to Lake Erie, for the interchange of high-grade Lake Superior ores and cheap Pittsburg coal, makes its early realization quite probable. The United States Government has given the nation a free canal at Sault Ste. Marie, through which already passes an annual tonnage greater than that of the Suez Canal; and its huge canal lock, 515 feet by 80 feet, capable of taking in at once from four to six vessels of average size, having proved insufficient for the constantly growing traffic, an additional one is now under way. This is to be still larger, measuring 800 feet by 100 feet with a depth of 21 feet on the miter sills.

Let us hope that the time is not far off when the Government will better appreciate the advantages of free internal waterways and will provide for building, in addition to the Ohio and Lake Erie canal already mentioned, ship canals connecting Lake Erie and Lake Ontario on American territory, connecting the Mississippi with the Great Lakes at Chicago, giving Baltimore an outlet to the sea across the Delaware peninsula, thus shortening the travel for its northern commerce by from 215 to 286 miles, crossing the Florida peninsula and thus diminishing the length of the voyage for the Gulf commerce by from 400 to 600 miles, and crossing the upper Michigan peninsula, thereby saving 271 miles from Duluth to Chicago, to say nothing of numerous other projected improvements in our internal navigatiou less striking but scarcely less important.

STREET AND ROAD MAKING DATA.

MAYOR HART, of Boston, recently addressed to James G. Blaine, Secretary of State, a letter suggesting that in view of the interest now attached to street and road making in this country, the U. S. Consuls in several of the foreign countries be asked to report upon the subject.

Among the important points to be considered were mentioned the materials used for streets having heavy and light traffic, the cost of building and maintaining such streets, and the assessment of first cost and maintenance. In the matter of material it was requested that the source and treatment of such should be stated, as well as the cost. Mayor Hart appropriately remarked that nearly every country and city has acquired some information upon these topics, and that the Department of State will deserve the special thanks of the country by making this information accessible.

It is gratifying to note that Secretary Blaine has taken the matter in hand at once, the different consular officers having been instructed to report upon the subject in their several districts. There can be no doubt of the great practical value which these prospective reports will have, and engineers and others, interested in street and road making, will have some reason to look forward to their completion as a means of making accessible the accumulated experience of a comparatively large number of men in this particular field.

A good, though independent, beginning in the matter has already been made by the American Consul at Liverpool, Mr. Thomas H. Sherman, whose report on the pavements, street-car lines, sewers and artisans' dwellings of that city form a valuable chapter in one of the recent numbers of "Consular Reports." Though this information was included in the articles on pavements and street railroads which appeared in earlier numbers of The Engineering Record, and have since been republished in "Pavements and Roads," we give in another column an abstract of Mr. Sherman's report. The specifications for street paving are particularly interesting, since the city of Liverpool boasts of having the best paved streets in the world. What Mr. Sherman has thus already accomplished in the collection of street-making data ought to serve as a fair indication of the kind of information likely to prove valuable, but, in any event, the movement started by Mayor Hart cannot fail to yield good matter.

THE SECRETARYSHIP OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

In another column will be found an interesting letter from G. Leverich, a member of the American Society of Civil Engineers, and at one time its Secretary, regarding the nomination, made by the regular Nominating Committee, for the office of Secretary of the Society.

The objection made in this communication to the eligibility of the person nominated for the Secretaryship, upon the theory that he is not a "Member," and that the Constitution of the Society confines the right of holding office to such as are Resident Members, has also been made by the Executive Committee of the Board of Direction, in a circular issued to the members announcing the candidates nominated by the Nominating Committee. In spite of this circumstance, however, we have been unable to find any clause of the Constitution which sustains that view. Confusion has apparently arisen from the fact that Section 2 of Article 2 of the Constitution, provides that "the Active Members of the Society shall be divided into three classes, styled, respectively, Members, Associates, and Juniors. Associates and Juniors shall possess all the rights and privileges of members, excepting the right of voting." "Members," as designating a class, are, therefore, not more Active Members than are Associates and Juniors, and it cannot be claimed from this clause that the right to hold office is confined to any one of the three classes to the exclusion of the others. It is a recognized rule of the law of corporations that the right to hold office is not confined to persons owning stock and having the right to vote, unless the organic law of the State, or the charter of the corporation, or its constitution or by-laws specify such qualifications as being necessary. In so far as the question depends upon precedent, it would seem that the point raised is worthy of consideration; but we submit that the rights of the majority are not to be controlled by the mere fact that, in the past, the office has happened to have been filled from a particular one of the three classes named in its Constitution, since the question of the eligibility of the members of the other classes has not been before the Society.

We are unable to find in the Constitution or By-Laws of the Society, or in any laws under which it is organized, any restriction upon the rights of any grade of members to hold office. The contention that "the Secretary is, ex-officio, a director, and, therefore, under the laws, a trustee, having with his fellow-members of the Board of Trustees, a vote in the Society's affairs," etc., is not conclusive, for the reason that the duties of a trustee are imposed by law upon the secretary, and his right to vote and otherwise act as a trustee, is a creature of the law and not in any sense an act of the Society; in other words, the Society can, if it chooses, select a man as secretary, who, then, by operation of law, is entitled to vote *as a Director*, but who, at the same time, may not have the right to vote as a member.

The question of residence, as affecting the nomination, seems to us, after all, of little moment, since a secretary will, as a matter of course, live in New York. It was certainly never contemplated that the Society must limit its selection of candidates to the persons who were residents of the city at the time of the nomination, though it would seem that under a strict construction of Clause 4 of Article 7 of the Constitution, the nominee of the Committee should have become a resident member before his name could have been presented. It seems obvious that the intent was that the officers elected should be residents during their terms of office, and considering the ease with which a non-resident member may become a resident member, and the fact that engineers are a migratory class, it seems unreasonable that the Society should be practically restricted to the city of New York in its selection of a candidate for the office of Secretary.

The Nominating Committee have, however, apparently made a technical error in presenting the name of a non-resident member without first requiring that he change his residence, which could have been done in a single day. The fact remains that they have made the nomination, and that the time within which they shall do so under the Constitution has expired. Any other five members, however, can, before December 1, nominate the same gentleman for office under Clause 6 of the same Article, which imposes no limitation as to residence. This will get over that technical difficulty. It will be seen from all this that the so-called Constitution is a very loosely-drawn instrument, and the first thing the Society had better do is to authorize the committee who are considering its revision to employ competent counsel to advise them in regard to its provisions.

We confine ourselves simply to the constitutional questions raised. The other features of the case we shall be glad to have our readers discuss, and the use of our columns is offered to them for that purpose.

NOTES.

The Galveston, Tex., City Council, has entered into a contract with J. H. Miller & Co., of Chicago, to bore an experimental artesian well, 3,000 feet deep, for which the city binds itself to pay Miller & Co $75,000 on its completion. Should this well prove a success others will be bored, and the city thus supplied with water.

At a meeting of the Pennsylvania Ship Canal Commission, held at Pittsburg, on November 12, it was stated that the canal would probably cost $26,000,000, and the chances were that if the State or Government would not construct it that a private corporation would. The surveys thus far made show that the line of the canal will be 102 miles long. The deepest cut will be near the crossing of the New York, Pennsylvania and Ohio Railroad near Sharon, and a few miles south of that is a deep ravine which will either have to be bridged by an aqueduct or the route of the canal will have to be run several miles to the eastward.

If the writer of the letter on "Cements" will send us his name and address we will be pleased to give the matter attention. Anonymous communications will not be noticed.

Within the next few weeks the Galveston Dredging and Land Reclamation Company, of Galveston, Tex., will commence active operations in Galveston Bay.

THE STEVENS INDICATOR.

The October number of *The Stevens Indicator*, published at Stevens Institute, Hoboken, N. J., contains a variety of interesting and valuable matter.

The opening article is a continuation of an earlier contribution on "The Fabrication of 12-inch Mortars," by Messrs. Fuller and Connet. "Magneto-Motive Force" is treated of by Thorburn Reid, and "A New System of Steam Radiating Pipes for Railroad Passenger Cars" is described by Robert M. Dixon. Prof. Thomas B. Stillman contributes an interesting paper on "The Analysis of Water to Determine Scale-Forming Ingredients." Other papers are by William Whigham on "An Analysis of Tractive Force in the Locomotive;" Prof. H. A. Wood on "Pascal's Triangle Applied to the Solution of Problems in Combinations and Permutations, and to Determine the Co-efficients of the Binomial Formula;" Prof. J. E. Denton on "The Action of Lubricants;" H. P. Jones on "A Comparison of the Ball Automatic Cut-Off Gear and the Stephenson Link Motion," and Prof. Jacobus and Riesenberger on "Ledoux's Equations for the Latent Heat of Ammonia and Sulphur Dioxide." The last is a most valuable contribution to the literature of ice-making engineering.

OBITUARY.

Gen. Jacob W. Hoysradt, one of the most prominent citizens of Hudson City, N. Y., died on November 15.

Frank Hopke, a civil engineer in the service of the New York Central Railroad, died at Hastings on Hudson, on November 13.

Gilbert Peterson, a well-known contractor, and recently engaged on the Washington reservoirs and aqueduct work, died at Lockport, N. Y., on November 14.

Joseph Flannery, for many years prominently identified with the manufacture of gas in all parts of the United States, died of heart failure, at New York, on November 15.

William Bromley, a member of the firm controlling the Quintard Iron Works, New York, and the Superintendent of the company for the past 22 years, died on Monday last, of Bright's disease, at his home in Bloomfield, N. J. Mr. Bromley was 72 years old.

Daniel Runkle, President of the Warren Foundry and Machine Company, of 160 Broadway, New York, and also of the Rochester Gas Light Company, died of Bright's disease of the kidneys after nearly a year's illness, on November 17, at the home of his son, H. G. Runkle, at Plainfield, N. J., aged 68. Mr. Runkle was one of the founders of the Thomas Iron Company, and his home was in Asbury Park, N. J.

PERSONAL.

James Gaffney has been elected to the office of Plumbing Inspector at Tacoma, Wash.

William C. Irwin, Chief Engineer of the Cleveland, Cincinnati, Chicago and St. Louis Railroad, has resigned after nearly 30 years' service. From 1881 to 1885 he was Bridge Engineer.

Charles E. Webster, formerly Chief Engineer of the Schuylkill road, has been appointed Assistant Chief Engineer of the Lehigh Valley road.

F. E. Abbott, has resigned his place as City Engineer of Gloversville, N. Y., and is now Inspecting Engineer for the Illinois Steel Company, with offices at The Rookery, Chicago, Ill.

General John Newton, formerly Chief Engineer, U. S. A., and more recently Aqueduct Commissioner of New York, has been invited to become Supervising or Consulting Engineer to the Hennepin Canal Board at Chicago.

ENGINEERING SOCIETIES.

Secretary Hutton of the American Society of Mechanical Engineers, has issued a circular announcing that the refitting, decoration and furnishing of the society's house, at New York, is now completed, and a definite policy has therefore been determined upon as to the general use of the building, more especially as to the two upper floors. On the ground floor the small front room has been fitted up as an office, committee and council room and will be used as a clerk's office when not otherwise required. It is brilliantly lighted at night, and will be particularly convenient for a writing room during evening hours. On the parlor floor is the main office, which is used as a members' rendezvous and general headquarters. Back of this is the auditorium, two stories high. On the second floor is the library, occupying the entire body of the house, and the gallery of the auditorium.

On the third and fourth floors six available rooms have been plainly but comfortably furnished as sleeping apartments; and it is intended by the House Committee that these rooms shall be at the service of our members. It is hoped that they will be frequently used, not only because they will be found to be in a convenient part of the city for members coming from out of town, but also because the revenue received will immediately aid the society's new enterprise. Meals are not supplied. A uniform rate of $1.50 per night is charged for all rooms, or $10 per week when taken in this way.

The library, with its system of individual incandescent lights, is very much more home-like than a hotel room can be; it is quiet and possesses congenial atmosphere.

Announcement is made, also, of the fact that there will be a semi-social and professional re-union of the society with their ladies on the evening of Friday, November 28, at the society's house. The occasion for this re-union is the official unveiling of the fine, life-size oil portrait of the late Alexander Lyman Holley, one of the founders of the society, and created honorary member in perpetuity. The date has been chosen as the day after Thanksgiving, in order that any Western members passing through the city on their way back from New England celebrations of the season, might be able to be present at this, the first re-union of the society in its new house since its redecoration and refitting for the society's use. There will be a short speech of welcome, to be followed by the address appropriate to the unveiling, which will be delivered by Mr. James C. Bayles of the society. After this will be a social re-union in library and reception rooms, and a collation in the society's banquet room, giving to the occasion the festal nature of a "house-warming"

If this re-union proves successful in attracting any considerable number of the non-resident members, it is proposed that there be inaugurated a series of re-unions for the members of the society and their ladies, during the winter, to give opportunity for social and professional intercourse in the society's house. The expenses of such re-unions are to be borne by those participating in them, or, at any rate, from a fund entirely outside of that which belongs to the society's regular work and income.

The annual meeting of the Mechanical Engineers' Library Association will be held at New York on the evening of Friday, November 28.

A regular meeting of the Track and Bridge Builders' Association was held in the Directors' room at the Union Depot, St. Paul, Minn., on November 14, at which John Copeland presided. The topic for discussion was a paper previously submitted by Mr. Amos, of the Soo line, upon the construction of pile and trestle bridges. Every road in the Northwest was represented at the meeting. Following this paper was one of more popular interest, by Mr. McMillan, also of the Soo, on the "Discipline and Management of Trackmen." At the December meeting of the Association the main topic for discussion will be a paper by Mr. McCutcheon, of the Chicago, Milwaukee and St. Paul, upon "The Best Time and Method of Renewing Ties."

A regular meeting of the Civil Engineers' Club of Cleveland was held on Tuesday evening, November 11. Twenty-three members and three visitors were present. James Wallace Kelly and Frank Walter Wilson were elected active members. Mr. Eisenmann reported the action of the committee at Chicago, appointed to formulate a plan for an International Congress of Engineers.

Prof. Harry Fielding Reid, Ph. D., presented a paper on the "Muir Glacier." It covers an area of 1,000 square miles, and has two termini, one at tide-water and the other several hundred feet higher. The lower terminus, one and one-half miles wide, is about 250 feet above the water, and extends an unknown depth into the water, which has been sounded to the depth of about 1,000 feet. From this terminus, immense masses of ice are continually breaking off, falling into the water, and floating away as icebergs. One most remarkable phenomenon was observed, the existence of a central moraine extending from end to end, moving in two opposite directions, and apparently having no beginning. After much difficulty the velocity at the lower end was found to be 8 or 10 feet per day; at the upper end it is probably between 2 and 3 feet. The belief is that the glacier is receding, and to determine this, permanent stations have been established from which observations will in the future be made, and other means taken to ascertain whether or not one part is not what is called a dead glacier. The ice was observed to have different colors, depending on the amount of sunlight it had been exposed to.

At the conclusion there was an interesting discussion of a number of the remarkable phenomenons observed.

A regular meeting of the American Society of Civil Engineers was held at New York, on November 19. The special topic for discussion before the members was the paper on "Self Purification of Water in Flowing Streams," which had been presented at a previous meeting by Charles G. Currier, M. D.

The Boston Society of Civil Engineers had an excursion to Salem, Mass., on Wednesday afternoon, November 19, and visited the works of the Massachusetts Broken Stone Company. The party, numbering about 25, were given every opportunity for inspecting this plant, and were much interested in the quarrying, crushing, elevating and sorting of stone for road metal, the crusher used being of the Gates pattern, and capable, it was stated, of crushing one ton of stone per minute.

In the evening the society held its regular meeting at the American House, Boston, at 7:40 o'clock, with President Clemens Hershel in the chair, S. E. Tinkham, Secretary, and about 75 members and visitors present.

Walter Jenney, of Boston, was elected a member. A communication from the Secretary of the International Engineering Congress having been read, it was voted that the Board of Government of the Boston Society should appoint a delegate to represent that society at the Congress. The feature of the meeting was the consideration of the subject of "Roads and Road-making." the first paper was presented by Prof. C. F. Allen, in which he dealt with the subject under the heads of location, form of cross-section, workmanship, and materials, maintenance, and, lastly, legislation. In the papers which followed, Mr. W. E. McClintock entered into a general consideration of the subject, and gave some interesting results of his experience, particularly when City Engineer, of Chelsea, Mass. Mr. E. W. Howe gave an account of the methods employed in road construction and maintenance, especially with reference to those of the Park system of the city of Boston.

In the general discussion which followed, Albert F. Noyes, City Engineer of Newton, Mass,, Mr. Aspinwall, and several other members and visitors took part.

UNDERGROUND ELECTRIC CABLES AT CHICAGO.

According to a paper by F. E. Degenhardt, recently read before the Chicago Electric Club, the cables laid underground in the city of Chicago are placed in conduits of various kinds—viz., iron pipe laid in the earth without other protection; iron pipe laid in concrete; iron pipe, cement lined, laid in concrete and multi-tubular blocks of bituminous concrete about 4 feet long.

Manholes in many cases are built circular in form, and in other cases rectangular shaped, the latter averaging 46 inches in length by 40 inches in width, and are from 4½ to 9 feet deep, with double iron covers, one of which is set below the grade and made water-tight by packing, the other set on a level with the street.

The iron pipe used for conduit is thoroughly reamed at the ends, thus removing the burr. Conduit is laid with a pitch of difference of grade from 6 inches to 1 foot, so as to draw into the manholes, thus disposing of all drip from condensed moisture.

The annual meeting of the Western New York Association of Architects was held at Buffalo, N. Y., on the 18th inst.

THE CALLIOPE DRY-DOCK AT AUCKLAND, NEW ZEALAND.

In a paper recently presented to the British Institution of Civil Engineers Mr. John H. Swainson gave substantially the following account of the Calliope dry-dock, at Auckland, New Zealand:

"Since 1879, the port of Auckland has had the use of a small dock, situated on the southern shore of the harbor, near the wharves and business portion of the town. This dock, until about the time of the wreck of the steamship 'Triumph,' at Tiri-tiri, had proved, with few exceptions, though limited to draughts of 13 feet or so, equal to the ordinary requirements of the mercantile shipping visiting the port. On several occasions, however, business has been lost to the city for want of a larger dry-dock.

"It was therefore decided to construct a new dock at Calliope Point, a small promontory midway between Depot Point and the entrance to Shoal Bay, on the northern shore of the waters of the Waitemata, which form the Harbor of Auckland.

"With the exception of a certain amount of mud at the entrance, the whole of the excavation was in soft gray sandstone rock, with occasional hard bars and laminated veins.

"Vertical fissures were met with here and there, but never of any size to cause trouble; and during the excavation of the rudder-well, the bottom of which was 55 feet below high-water mark and within 140 feet of the tide, the whole amount of leakage into the dock was only 83,121 gallons per diem.

"On the 5th of November, 1885, being one week less than a year from the signing of the contract, the first shovelful of concrete was laid by the engineer, Mr. Errington, and the dock was opened in February, 1888. The dock is 500 feet long, 40 feet wide on the floor, and has a width of 110 feet at the level of the cope, the center line running southeast half east.

"The excavation for this, the greater portion, is 116 feet wide to the level of the rock, or in the rock to a depth of 12 feet from cope level; a bench 5-foot in width reduces it to 106 feet for the next 8 feet in depth; again further reduced by another 5 feet bench, between 20 and 34 feet levels to a breadth of 96 feet; the bottom portion below this again is 76 feet wide, the floor of the excavation being formed concave to a radius of 149 feet, with a fall of 15 inches in the length of the dock, the center being 47 feet 1 inch below the surface of the ground at the head, and 48 feet 4 inches at the sill.

"Down the center of this runs the 9 inch earthenware drain, laid in concrete in a trench; above this, and all over the floor of the excavation, is a 12-inch layer of ordinary concrete without rubble. This is made in the proportion of 6 to 1 as follows: 2 parts of bluestone broken to 2½-inch gauge, 2 of gravel up to the size of an egg, and 2 of coarse sand to 1 of cement, tested after seven days to stand a strain of 450 pounds per square inch of cross section. Above this bottom layer of concrete there is an invert built of seven rings of brickwork set on edge in 2 to 1 cement mortar.

"This is 60 feet in breadth, and the portion forming the skewback between the edges of the invert and the sides of the excavation is filled in with rubble concrete. The floor of the dock above this invert is formed of rubble concrete, and is convex in shape on the surface, having a camber of 3 inches, all surface water being by this means kept to the sides, where it is conducted by channels to the rudder well and pump wells at the outer end of the dock; the workmen are thereby enabled to repair the keel or bilge of a vessel without standing in water meanwhile.

"The total thickness of this floor in the center is 7 feet, and it has the same fall as the excavation, 3 inches in 100 feet, the center being 40 feet 1 inch at the head and 41 feet 4 inches at the sill below cope level. Keel blocks, made of pohutukawa, a native timber, heavy, tough, and impervious to the teredo, are placed 5 feet apart, center to center, down the dock.

"The rudder well is 21 feet up the center line from the sill, and is directly opposite the culvert leading to the main pumps. It is 10 feet in diameter, and 15 feet deep, with a hemispherical bottom, and is built of brickwork 2 feet 3 inches in thickness, backed by 12 inches of concrete. Besides the 9 inch pipe discharging the leakage into this well, a 6-inch pipe conveys the surface water from the channel on the southwest side to it, and a 12-inch earthenware pipe conveys the drainage, etc., thence below the pumping culvert in the direction of the drainage pump, The coping round this well is made of local stone, 12 inches in depth, and is fitted with an iron grating in six sections, supported by one removable iron girder.

"At a distance of 20 feet from the center line on either side rises the first of the seven altars, each 2 feet in height, which form the lower series. The first two of these are 3 feet 7½ inches in width, including the batter, 1 in eight, which is used on all faces, except the caisson ledge and chamber buttresses, throughout the work. The next four are 2 feet 9 inches wide, the upper one or broad altar being 3 feet 9 inches wide. The breadth across the dock at this point, the foot of the deep altar, is 84 feet. Three flights of steps—one central and one 50 feet from either end—give access from the broad altar to the floor on each side of the dock. Above these rises the deep altar, 11 feet 4 inches high, and four 4-feet altars; these, with the exception of the top one, which forms the cope, 3 feet wide, have a width of 2 feet 4¾ inches exclusive of the batter. Four flights of steps, one at each corner of the dock, provide a means of communication between the surface and the broad altar.

"The head of the dock is formed by a battering wall, 40 feet in height, running at right angles across the dock, broken in the center by a recess for the bows of vessels which admits of two more flights of steps, from surface to floor, divided by a timber slide down the center.

"All these altars and walls were built of rubble concrete, in layers about 2 feet or more in thickness, and not less than 50 feet in length, composed of rough irregular blocks of basaltic rock, bedded in and surrounded by the ordinary 6 to 1 concrete. The faces of the altars were worked up smooth against frames formed of 2-inch boarding, braced, shored, and weighted on the outside, and accurately set to level line and batter.

"The walls at the head and the deep altars required more permanent framing; the ordinary frames were used for the first 2 feet, above which and affixed thereto were uprights, 6 inches by 3 inches, battering inwards, to which a face of 2-inch boarding was attached, the whole being shored up and kept in position, as the wall was built inside, by the gantry.

"The center portion, for a breadth of 41 feet, is struck to a curve of 140 feet radius; this is connected by a bilge curve of 20 feet radius, on either side, to the battering portion 21 feet in height, which gives a total breadth at the surface level of 80 feet. High water of ordinary spring tides gives a depth of 33 feet above the center of the sill. The rise and fall of the tide averages about 10 feet. The sill is constructed of large blocks of Melbourne stone, laid in 18-inch courses, in 1 to 1 Portland cement mortar, well grouted in; this is backed by rubble concrete to the bottom and sides of the excavation, a bulkhead of neat concrete, without any rubble, being inserted behind the caisson quoins to assist in forming a water-tight joint; the brick invert of the floor being also returned up to the underside of the stones composing the inner edge of the sill. The caisson quoins are alternately 5 feet and 4 feet in length, and for the first 24 feet, on either side of the center line, the courses are from 3 feet 9 inches to 4 feet in depth. Above this the courses are alternately 3 feet and 2 feet 6 inches deep, the coping being a 2-foot course 3 feet broad on the surface. The first five of the 5-feet caisson quoins on either side of the center line project into, and are checked down to the level of the floor of the caisson groove, thus bonding the work together.

"The caisson ledge on the end of the quoins is 16 inches in breadth, and is fine-axed and rubbed down to a perfectly vertical plane, to form the joint with the wood facing of the caisson; beyond this the end of the quoins where visible is checked back 1 inch to ensure the bearing face being clear. With the exception of the ledge all exposed portions of this stonework are tooth-axed.

"The caisson groove and chamber are 15 feet 6 inches wide upon the floor, which is level, 1 foot 6 inches below the center of the sill, 3 feet 6 inches in thickness, and 160 feet 9 inches in length; the walls of the chamber batter upwards to within 2 feet of the cope, and are 4 feet 6 inches thick at the level of the floor, where the excavation is in the rock, but are thickened out another 5 feet 6 inches above the level of the rock, the back of the wall being vertical. The end wall is rather thicker above the rock, in order to furnish a broad enough foundation for the discharge culvert, which is built in it, and the caisson hauling gear above. In addition to the vertical walls at the entrance, which are faced with dressed stone from below low water level, there are two vertical buttresses on each side, and one in each of the inner corners of the chamber, measuring 5 feet on the face. In the center of the face of each of these side buttresses there are grooves into which are dropped totara fenders, projecting 2 inches beyond the face in order to protect the timber facing of the caisson from being injured by the concrete walls. These buttresses also support horizontal kauri stringers and blocks, to which are attached, over and between the buttresses, cast-iron plates, with rollers, carrying the chain cables of the caisson hauling gear.

"The caisson hauling gear is fixed on a concrete floor at the northeast end of the caisson chamber, 5 feet below the cope level, and consists of a 6½-inch horizontal shaft, resting on three plummer-blocks, firmly bolted to stones bedded in the floor, with two chain pulleys, one at each end, and two toothed wheels, worked by worm wheels on the vertical shafts of capstans, fixed on the timber floor above on the surface level. Two corresponding pulleys, fixed on the vertical walls at the entrance to the chamber, complete the gear.

"The western end of the caisson groove forms a portion of the entrance walls, which are 83 feet apart at cope level, and extend seawards to the outer edge of the apron, which is level across, 1 foot higher than the floor of the caisson grooves the outer (seaward) edge being bevelled off. Beyond the apron, 31 feet from the sill; these walls have curved returns, at a radius of 10 feet on cope level, and form the eastern and western wing-walls, the former being 98 feet in length in the straight, and the latter 75 feet, including a flight of watermen's steps, which forms a finish in this direction.

"The western side of the dock-yard is protected from the wash of the sea by a pitched slope. The filling culvert is situated on the western side of the entrance, and is 5 feet 6 inches in height and 4 feet broad, with an invert floor and segmental arched roof.

"The mouth of this culvert, which is formed in the masonry of the west wing-wall, is slightly bell-shaped, to make up the amount of waterway lost by the iron grating fixed in a rebate at the outer edge to prevent the influx of timber, rubbish, etc.

"Directly opposite the rudder-well, on the east side of the dock, is the mouth of the culvert leading to the pumps; this is covered with an iron grating to prevent chips and other rubbish finding their way to the pumps. The penstock shaft is built of 14-inch brickwork backed with concrete. This portion of the culvert is level, the bottom being the same level as the floor of the main pumps, 51 feet 6 inches below the cope. Just beyond the penstock it opens with a bell-mouth into the suction chamber, 15 feet long by 5 feet wide and 31 feet high; this divides with two openings leading to the two main pump-wells, the lower openings being fitted with a framework of flap-valves.

"The lower portion of the pump-wells is 10 feet 6 inches in diameter by 11 feet in height, and contains three large standards, which carry the cage and glands in which the plunger works; a cast-iron floor with valves, etc., divides this from the middle portion, which is 12 feet in diameter, and, including the domed portion, 16 feet in height; this contains the cage, and a wrought-iron bulkhead divides the inlet from the outlet portion. The upper part of these wells is 25 feet deep, with a diameter of 8 feet. Two branch culverts lead from these shafts to the main discharge culvert, which issues through the east wing-wall, at a distance of 17 feet from the end.

"Each of the pumps is worked by a separate engine, which, with the pumps themselves, are made from the designs and at the works of Messrs. James Watt & Co., Birmingham. The pumps are calculated to empty the dock from high water, a quantity of over 40,000 tons, in 4½ hours.

"There is also a drainage-pump, connected by a 2-foot earthenware pipe laid in concrete with a sump in the main suction-chamber, directly opposite the mouth of the pumping culvert.

"The 12-inch pipe from the rudder-well discharges into this. his well is divided into two portions, the lower of which, containing the suction-pipe, is 4 feet 6 inches by 3 feet, and 19 feet 6 inches in height; the invert floor of this is 54 feet below the floor of the engine-house; access to it is obtained by a manhole in the invert of the upper portion, which is 7 feet by about 6 feet in breadth. This contains the valve-box and pump-barrels, three in number, and 11 inches in diameter, worked by toothed gear from a small vertical engine. The discharge from this well is conveyed by a 15-inch earthenware pipe round the end of the caisson chamber, and issues through the arch of the main discharge culvert, between the penstock and the back of the wing-wall.

"This pump is capable of forcing water to a proposed tank on the top of the cliff, 100 feet above the dockyard level, for fire-preventive purposes. Fresh water was obtained from a bore-hole sunk to a depth of 300 feet in the rock on the east side of the dock; this water was used for the boilers during the work, and will be of great service for the permanent boilers of the pumping engines.

"The caisson was designed and made by Messrs. Head, Wrightson & Co., of Stockton-on-Tees. It is built of wrought iron, and is 83 feet long on the deck, 15 feet wide over the timber facings, and 41 feet 6 inches deep over all; it is of the box-caisson type, the sides being vertical, 13 feet 6 inches apart; the ends batter downwards at 1 in 8 for 28 feet 6 inches, below which the stem and stern are cut off at an angle of 45 degrees, leaving a length of 48 feet on the floor. The keel pieces are of greenhart, 12 inches by 8 inches, one on each side of the bottom of the vessel, and are bolted to 5 inches by 5 inches by ½ inch angle-iron riveted to the floor-plates, which are ⅞ inch in thickness. The caisson is divided into four parts by bulkheads, and has a water-tight deck running the full length of the vessel, 16 feet below the covering plates, and a tank floor at the depth of the top plate, for a length of 24 feet in the center.

"There is a 12-inch valve opening from the water-tight deck to the sea on each side of the caisson, and also 9-inch ones from the water-ballast tank. A hand-pump on a small deck below the water-tight deck connects with either the bilge, the sea on either side, or the water-tight deck, and delivers either outside or into the tank, provision being made for affixing hydrants in case of fire."

Mr. John H. Swainson was appointed by the Harbor Board to superintend the construction of the work, under the direction of the engineer, Mr. William Errington, M. Inst. C. E., and was assisted in the work by Mr. G. Harden.

THE CORINTH CANAL.

THE Corinth Canal, which will sever the Peloponessus from the mainland of Greece, and will permit the largest ships to pass directly from the Gulf of Athens to the Gulf of Corinth, is said to be rapidly approaching completion. A recently published account gives some interesting particulars concerning the undertaking.

The work was begun some eight years ago by a French company. It was to have been finished in 1887, but various troubles delayed it, and now 1895 is named as the earliest date on which it can be opened for traffic. According to the original estimate, the total excavation was to be 12,065,000 cubic yards, including about 2,400,000 cubic yards for slips or eventual enlargements. The nature of the strata had, however, not been sufficiently investigated, the region being volcanic. When the cuttings had reached some depth a large number of faults were encountered and a considerable disturbance of the layers of deposit of the tertiary strata was revealed.

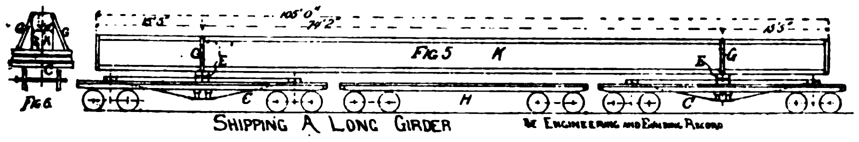
The canal will have no locks, but is level from end to end and perfectly straight. It is to be 96 feet wide and 36 feet deep. At the Corinth end it is crossed by a railroad bridge 164 feet high, under which the tallest ships may pass without lowering their topmasts. With the exception of about 200 yards in the center, the channel, it is said, has already been excavated almost down to sea level, and water has been admitted for about half a mile at the Corinth end and half that distance at the other. The total cost of the canal is reckoned at $14,000,000, or about $3,500,000 a mile. It is assumed that about 300 vessels from Trieste and Fiume, and as many from Italian ports, will pass through the canal annually, while it is calculated that 730 Greek ships will use the canal. This would give a total of 1,230 vessels annually, of an average tonnage of 1,500 each. It is proposed to levy a toll of 20 cents per ton on vessels coming from the Adriatic, and 10 cents on all other vessels, besides 20 cents for every passenger. This is estimated to yield an annual revenue of $300,000.

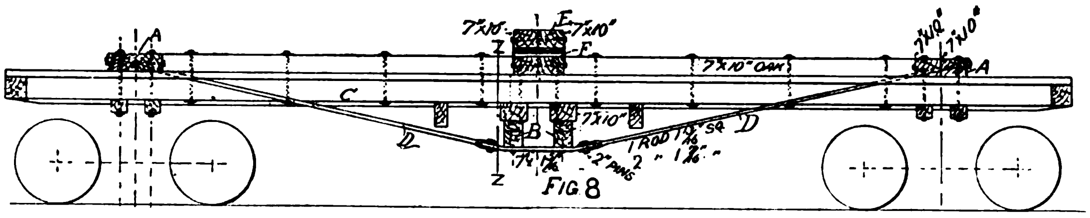
THE first case involving the right of the city of Philadelphia to pave streets occupied by streets railways with Belgian blocks, and compel payment for the same by the companies, was decided last week, when a verdict was given against the Ridge Avenue Passenger Railway Company,

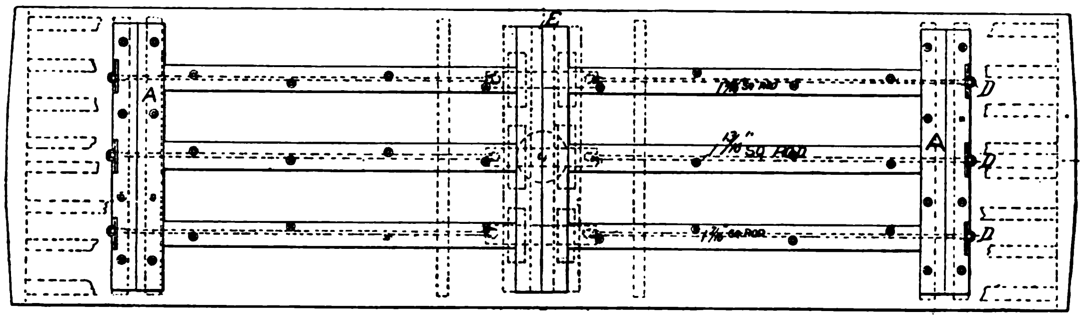
SHIPPING A LONG GIRDER.

FIGURES 1, 2, 3 and 4 show the construction of one of a pair of 105-foot box girders, 5½ feet high, that were built, assembled and riveted up complete in the shops of the Keystone Bridge Company, Pittsburg, Pa., and successfully shipped, on three platform cars each, to San Francisco, Cal. They are intended for the City Hall now being built there, for which William Patton, of San Francisco, is the architect. The girders are entirely of steel, with steel rivets, and weigh about 140,000 pounds each.

Figure 1 is a side elevation; Fig. 2 is a section at X X; Fig. 3 is an elevation along Z Z, and Fig. 4 is a section along Y Y, of Figs. 1 and 2. Owing to the great weight and length of the girders, special cars were required for their shipment, and were prepared and arranged as shown in Figs. 5 to 9. A girder is shown in elevation in Figs. 5 and 6 as it was shipped, supported by two trussed cars C C, the middle car H being merely a spacer, and not loaded or in contact with girder K. The girder rested on pillows at E and E, where it was vertically braced by struts G G, and had sufficient horizontal play to swing around the curves of the railroad track.







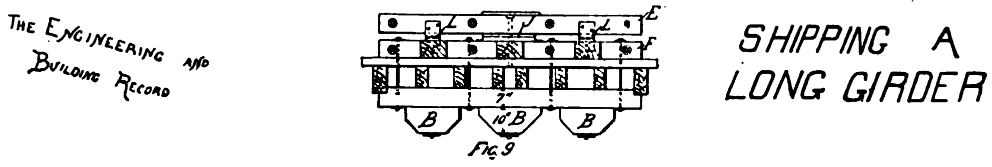


Figure 7 is a plan and Figs. 8 and 9 are elevations of the special cars C C. These were adapted from ordinary flat cars, to which were securely bolted the bearing beams A A and the strut blocks B B. When the truss rods D D were put on they practically formed the lower chord of a king post truss whose upper chord was composed of the bed of the car, and which was loaded at the pivot plate J and bearing plates L L, directly over its posts, B B B.

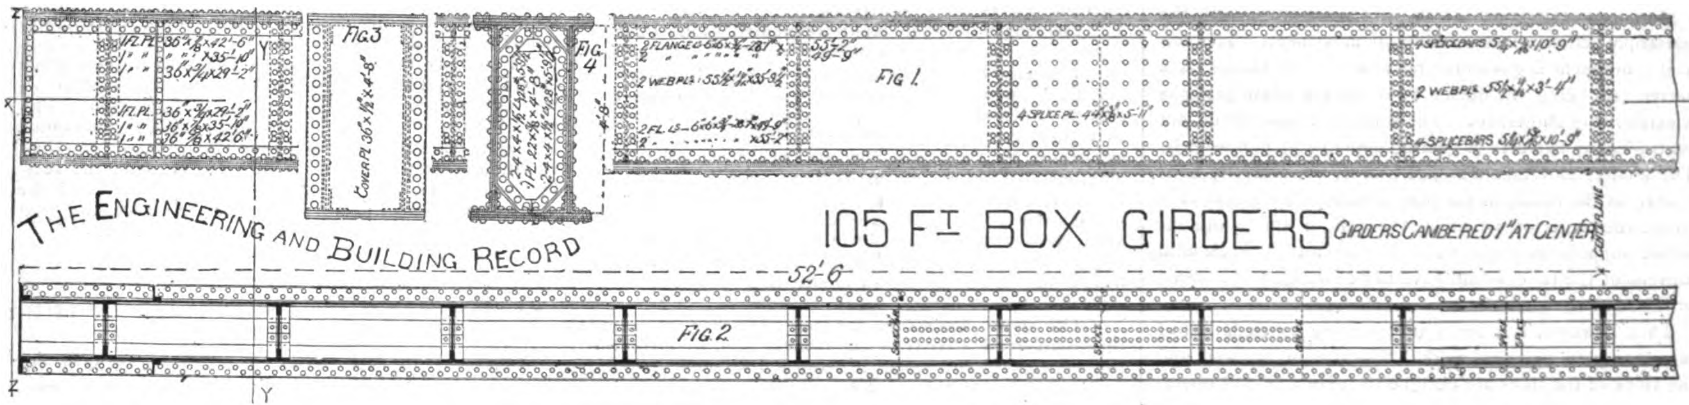
The arrangement worked satisfactorily, and after the first girder arrived in San Francisco the cars were sent back to Pittsburg and used to transport the second girder.



LIVERPOOL PAVEMENTS.*

THE city of Liverpool, which comprises an area of 5,210 acres, with an estimated population of 599,738, or 115 people per acre, and is said to be the most densely populated city in Great Britain, now points with pride to its 250 miles of "the best paved streets in the world." The American consul there, Mr. Thomas H. Sherman, says that the policy adopted by the corporation of Liverpool in the execution of public works in the best possible manner, and generally by their own workmen, has proved successful in every way; and, by a judicious capital expenditure, the cost of maintenance of the roads, sewers and other public works is reduced to a minimum, and the greatest economy is attained. He notes that the laying of the impervious pavement which was adopted in 1872 for the carriageways of the city has been continued without intermission, and is still in progress, resulting in nearly 1,750,000 yards superficial of impervious carriageway pavements and a saving by the execution of this class of work unprecedented in municipal experience.

Dealing with the year 1877, under the present City Engineer, the estimated expenditure for the general repairs to the roads in Liverpool was £23,000 ($136,080), the mileage of adopted roads at that time being 226 miles. Concurrently with the extension of the impervious carriageway pavements, the expenditure under the head of general repairs has been reduced year by year till the estimated cost for the year 1889 was only £8,400 ($40,824), with a street mileage under repair of 254 miles. Among the regulations worth noting are these:

1. Permission is never given to private companies or persons to cut through the pavement in any street for any purpose. When such work is necessary the city corporation will do it in its own thorough way, and the interested parties must pay the entire cost.

2. All the street railway tracks (tramways) are laid and owned and kept in condition by the corporation, and the company leasing them for traffic pays an annual rental of 10 per cent. on their cost. The manner in which these rails are placed is fully shown in an illustrated report of the former City Engineer, who says: "The Liverpool city lines as now laid are conclusive proof that when tramways are well designed and properly constructed they do not form the slightest impediment, even to the narrowest wheeled vehicles."

The streets are divided into three classes, the pavement designated as first class being usually laid down in the main streets in the central parts of the city where the traffic is heavy. The specifications read as follows:

First-Class Streets.—Excavate or fill in the ground, as the case may be, to the requisite level, and remove all surplus material. Properly form and trim off the surface and thoroughly consolidate the same, and then lay foundation of not less than 6 inches of Portland cement concrete, corporation standard. The paving shall consist of granite or syenite sets, 3¼ inches wide by 6¼ inches deep, from North Wales or other approved quarries, laid in regular, straight and properly bound courses, with close joints, and to be evenly bedded on a layer of fine gravel half an inch in thickness. After the paving is laid the joints shall be filled with hard, clean, dry shingle; the sets shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted until completely filled with hot asphalt, composed of coal pitch and creosote oil, and, finally, the pavement is to be covered with half an inch of sharp gravel.

The crossings shall consist of three rows of 16 by 8-inch granite crossing stones, and the remaining space shall be paved on each side of the crossing stones to the full width of the footway, in a similar manner to the carriageway. The crossing stones shall be of granite of a quality to be approved by the engineer, dressed perfectly true, and out of winding on the face; the sides and joints to be perfectly square and accurately dressed throughout their entire depth; the stones to be bedded on cement concrete, the joints to be filled with shingle and grouted with hot asphalt. A triangular groove an inch wide by three-fourths of an inch deep to be run along the upper surface of each stone. No stone to be less than 3 feet in length.

The footways shall be paved with Yorkshire or Lancashire flags of the best quality, not less than 3 inches thick. No flag to measure less than 2 feet in width or to be of less area than 6 feet; to be solid, free from laminations, the upper surface to be true and free from windings or hollows; the joints to be squared the whole thickness. The flags to be laid on a bed of fine gravel, with close, neat joints flushed in mortar, and in uniform courses breaking bond. The joints to be dressed after laying, where necessary.

The channel stones to be of granite or syenite, of a quality to be approved by the engineer, and to be not less than 3 feet in length. The upper surface, if not self-faced and perfectly true, must be accurately worked out of winding, the bed even and parallel to the face, the sides and ends truly square; the stones to be bedded on cement concrete, and the joints to be filled with clean shingle and grouted with hot asphalt.

The curb-stones to be granite or syenite, straight or circular as required, 6 inches thick at top, 7 inches thick at 5 inches below, and not less than that thickness for the remainder of the depth; to be not less than 12 inches deep nor less than 3 feet in length; to be carefully dressed on top, 8 inches down the face, and 3 inches down the back; the remainder of each stone to be hammer dressed; the heading joints to be neatly and accurately squared throughout the entire depth.

Second-Class Streets.—Excavate or fill the ground, as the case may be, to the requisite level, and remove all surplus material; properly form and trim off the surface, and thoroughly consolidate the same, and then lay a foundation (*a*) not less than 6 inches of Portland cement concrete, corporation standard, or (*b*) not less than 6 inches of bituminous concrete, consisting of clean and angular broken stone, grouted with hot asphalt composed of coal pitch and creosote oil, covered with chippings, and thoroughly consolidated by rolling with a roller of sufficient weight. The paving shall consist of granite or syenite sets 3 inches wide by 5 inches deep, or of granite or syenite 4x4-inch cubes from North Wales or other approved quarries, laid in regular, straight, and properly bonded courses, with close joints, and to be evenly bedded on a layer of fine gravel half an inch in thickness. After the paving is laid the joints shall be filled with clean, hard, dry shingle; the sets shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted until completely filled with hot asphalt composed of coal pitch and creosote oil, and, finally, the paving shall be covered with half an inch of sharp gravel.

---

* This subject was treated of at length in earlier numbers of THE ENGINEERING AND BUILDING RECORD, and is reprinted in the book on "Pavements and Roads," published at this office.

The crossings, footways, channels and curbs shall be the same as specified for first-class streets.

Third-Class Streets.—Excavate or fill in the ground, as the case may be, to the requisite level, and remove all surplus material; properly form and trim off the surface and thoroughly consolidate the same, and then lay a foundation of hand-pitched rock six inches in depth, set on edge in the manner of a rough pavement. Over this a coating of gravel is to be laid of sufficient thickness to fill in the interstices and to form a smooth surface to the foundation, which must be thoroughly consolidated by rolling with a steam roller before the paving is laid. The paving shall consist of 4x4 inch granite or syenite cubes from North Wales or other approved quarries, laid in regular, straight, and properly bonded courses, with close joints, and to be evenly bedded on a layer of fine gravel half an inch in thickness. After the paving is laid the joints shall be filled with clean, hard, dry shingle; the sets shall then be thoroughly rammed, and additional shingle added until the joints are perfectly full. The joints shall then be carefully grouted, until completely filled up, with hot asphalt composed of coal pitch and creosote oil, and, finally, the paving shall be covered with half an inch of sharp gravel.

The crossings, footways, channels and curbs shall be the same as specified for first-class streets.

A NEW FORM OF HYDRAULIC DREDGER.

AN hydraulic dredger, embracing several new features, has just been tried in England, at the port of Littlehampton.

As described in *Engineering*, the vessel is 50 feet long, and 14 feet wide, the draught of water being 22 inches. The machinery consists of a pair of horizontal pumping engines, supplied with steam by an ordinary return tube boiler. The pumps deliver into an air vessel, from which leads a copper pipe 4 inches in outside diameter and ⅛-inch metal. This, in turn, is attached to a leather hose, which carries the flow up to the top of the small gantry built over an open-bottomed well in the center of the vessel. The gantry supports a telescopic pipe, which passes down through the well, and directs the stream of water to the bottom of the river or harbor requiring to be operated upon. The telescopic pipe is supported in the gantry by a gimbal arrangement which, in combination with the telescopic action, gives a universal movement. The vertical component is governed by a wire rope wound on a barrel, this being the device by which the telescopic tube is extended or shortened. The horizontal movements are controlled by two sets of gearing actuated by handwheels. These latter movements are, of course, not perfectly horizontal, as the nozzle of the pipe describes a segment of a circle, the center of which is the axis of the trunnions which support the apparatus. To get a truly horizontal movement the tube would have to be swung, and lowered or raised at the same time.

This, however, is a detail in operating which is not of importance in practical work. The size of the well and the slope of the sides are designed to give a field of operation without shifting the dredger, which is said to be 30 square feet in area. The telescopic pipe has at its lower end a copper pipe ending in a nozzle 1½ inches in diameter. When operating in rough water a length of flexible hose is substituted for the copper pipe.

The vessel works by cutting away the bed with the jet from the nozzle, the latter being kept a few inches from the bottom. To convey the material away dependence has to be placed upon the carrying power of the tide or stream; and for this reason the craft might more accurately be described as a "disperser" than as a dredger, as the spoil is not brought to the surface.

The results obtained with the apparatus on the occasion of the trial appear to have been, in general, of a satisfactory character. *Engineering* states that the bottom of the river Arun, at the spot where the trials were made, is a stiff blue clay of a very tenacious character. It is said that this material was artificially brought to the spot to act as a puddle when the mouth of the river was diverted from its original course to the present configuration, some time, we believe, near the beginning of this century. Whether that may be the case or not (certainly 5 feet 6 inches seems a very thick puddle, even for the substantial days of the Georges), the clay, a large piece of which was brought up from the bottom, is admirably adapted for that purpose; and it is a matter upon which Mr. Baker, the designer of the dredger, might boast, that his jet has cut a hole over 5 feet deep in the space of five minutes, into a material that has stood the scouring action of the impetuous little Arun for 80 or 90 years.

EUROPEAN INLAND NAVIGATION.

FROM the recently issued report of Lieut.-Col. William E. Merrill, of the U. S. Corps of Engineers, concerning the International Congress of Engineers interested in the utilization of water for navigation purposes, held at Manchester, England, in July, 1889, we extract the following:

"In preparing a report on such matters connected with the congress as might be of interest to American engineers, I was much struck with the immense expenditure which France had made, and was still making, on her waterways, and with the magnificent results of this expenditure. In view of the hostility with which the River and Harbor Bill is sometimes attacked in the press of the United States, and of the unfriendly or indifferent feeling of a portion of the American public to existing artificial waterways in our own country, it seemed opportune to quote European practice and opinion in such matters, and no better example could be taken than France, which probably has the best system of artificial waterways in the world.

"Tolls on French waterways were wholly abolished in 1880, but in 1888 a proposition was made in the French *Corps Législatif* to re-establish them. This proposition was referred to a committee, who made a unanimous report against it.

"The French system of inland navigation (excepting some detached canals and rivers on the seacoast that specially subserve maritime interests) forms a vast network, on which it is practicable to go from one point to another without breaking bulk or changing boat.

"Thanks to the artificial ways that have successively been opened either by extending natural ones or by crossing the various water-sheds by canals with summit levels, the Seine, the Rhine, the Rhone, the Gironde, and the Loire are connected together.

"Paris is the natural center of the network of waterways. From this point of departure, which is surrounded by a vast curve or belt formed by the St. Denis and St. Martin canals, together with a part of the Seine, different great waterways lead towards:

The English Channel (Havre and the Bay of the Somme).

The Straits of Dover (Calais, Gravelines, and Dunkirk).

The Belgian frontier (towards Furnes, Ghent, Mons, and Charleroi).

The Swiss frontier (towards Basle).

The Mediterranean (Bouc and Cette).

The Ocean (Nantes and Brest).

"This radiating system is completed by the line from Bordeaux to Cette, which connects the Ocean with the Mediterranean.

"The navigable ways of France are divided into canals, canalized rivers, and open rivers.

"The length of canals really frequented by boatmen is 3,000 miles, and that of canalized rivers is 2,050 miles. On the open rivers the length that is actually navigable may be estimated in round numbers at 1,850 miles. Except 355 miles of canal and 46½ miles of river, conceded to various companies, all these navigable ways are administered by the State and are free from toll. The maintenance and extension of these waterways is under the charge of the engineers of *Ponts et Chaussees*.

"Until 1830 the great expenditures had been made for artificial waterways, and little had been done for the rivers, except to build a few locks and some quays and levees, and to cut off a few bends; otherwise the rivers were in a state of nature.

"The improvements in transportation had increased the commercial activity of the country, and to secure the full benefits of the canals it became absolutely essential to do something for the rivers. This was especially important, as great agricultural and commercial interests depend on river traffic, because the best lands are found in the river valleys, and here are located the populous cities and the great manufacturing establishments.

"The invention of dams with movable trestles, due to M. Poirée, Inspector-General of *Ponts et Chaussees*, which was successfully tested in 1834 at Basseville on the Yonne, came just in time to show the possibility of damming a river of any width without intermediate piers, and of restoring this river to its natural state whenever necessity required it.

"In 1835 the great work of improving the rivers was formally begun.

"In 1852 the success of the railroads, whose advent had been viewed with uneasiness and distrust, gave rise to a public opinion very unfavorable to inland navigation. It was considered doubtful if the latter could henceforward render sufficiently great service to compensate for the financial sacrifices which they had already necessitated and would still necessitate, and for this reason the Government lessened its expenditures, while continuing the projects already begun.

"In 1860 a revival occurred in favor of the boating interest, which was hailed as an indispensable check on the monopoly of the railroads, and various measures were taken by the administration to assist the water roads in maintaining a legitimate opposition to the iron roads.

"The so-called subscription tariffs, by which the railroads offered commerce a reduction of rates on condition of subscribing an obligation to use no other means of transportation, were suppressed; several waterways not embraced in the law of 1853, were bought up by the State, and many new canal companies were chartered; tolls on all State canals were reduced in 1860, and still further reduced in 1867. Work was also begun on a large scale on the improvement of old canals, on the construction of canals already under way, and on the radical improvement of the rivers.

"The total length of the artificial waterways opened under the Second Empire did not exceed 300 miles, the principal effort of the Government having been directed to perfecting the navigable network rather than to increasing its length.

"The seventeen years from 1871 to 1887, inclusive, may be divided into two distinct phases. From 1871 to 1878 the annual budgets were devoted to the burdens imposed by the events of 1870 and 1871; it was impracticable to do much for public works, and inland navigation felt the effects of the general depression.

"In 1878 the Government felt able to resume on a large scale the work of improving the waterways of the country, and a statement was prepared of the works that appeared to be of public utility.

"The following conditions were stated in the law of 1879:

"The water-ways of France were to be divided into two classes, in accordance with the nature and importance of the wants subserved by them: (1) Main lines; (2) Secondary lines. The main lines were to be operated by the State; the secondary lines might be leased for a limited time to companies or individuals.

"The main lines were to have the following dimensions:

	Feet.
Depth of water	6.6
Width of locks	17.1
Length of Locks between chord of lift-wall and lower gate recess	126.3
Clearance under canal bridges	12.1

"These dimensions could only be modified by an act of the legislative body.

"Secondary lines were not required to conform to the above-named dimensions.

"Between 1814 and 1887 the French Government spent the following sums on the *improvement of its rivers* and on the *construction of canals*.*

"It is but just to add that the splendid results attained in France are wholly due to the French corps of civil engineers (*Ponts et Chaussees*), a body of men recruited from the highest graduates of the Polytechnic School, and afterwards carried through the course of the *Special Ponts et Chaussees* school. Entrance into the Polytechnic is secured by competitive examinations, and as the best scholars of this selected body pass on to the *Ponts et Chaussees* school, it is seen at once that France has at her disposal for all engineering work a thoroughly trained corps of the ablest men in the country. The splendid results of their labors in all branches of engineering are the best possible proof of the wisdom that created the corps, which has now a continuous record of 174 years of work on the highways, bridges, railroads, rivers, canals, seaports, and lighthouses of France.

"France is the only country of continental Europe where the system of tolls finds defenders. Austria, as well as Germany, absolutely rejects the suggestion. The tolls that remain in Belgium are unanimously condemned by public opinion as well as by the Government, and their abolition is considered imminent. In Holland the feeling is the same, and one of the highest officials of the Waterstaat recently said 'it is absolutely necessary that we should suppress tolls, at least on the main lines.'"

(TO BE CONTINUED.)

METEOROLOGICAL OBSERVATORY IN THE EIFFEL TOWER.

MESSRS. RICHARD BROS., of Paris, describe in the *Bulletin de l'Association Francaise pour l'Avancement des Sciences* the meteorological observatory established at the top of the Eiffel tower.

At precisely 300 meters above the level of the ground a platform is placed, 5 feet 4 inches in diameter, which has been fitted up as an observatory. The lightning conductor passes down through the center, and the observations are transmitted by electricity to the Palace of Liberal Arts, a distance of 890 yards from the tower. The apparatus in the observatory consists of a maximum and minimum, and an ordinary thermometer; anemometers, raised on three iron tubes to a height of 13 feet, which mark the direction, the force, and the velocity of the wind; two barometers, and a rain gauge. Double venetian blinds, strongly built of iron, inclose the platform on all sides but one.

---

*$194,351,000 were expended in harbor work. This sum does not include the expenditure of $15,400,000 on the great breakwater at Cherbourg, as this is charged to seacoast defense.

Rivers	$113 268,400
Canals	152,678,700
Total	$265,947,100

SEWERAGE OF THE DISTRICT OF COLUMBIA.

In August of last year the President of the United States, in conformity with the act making appropriations for the expenses of the government of the District of Columbia, appointed a board of sanitary engineers, Messrs. Rudolph Hering, Samuel M. Gray, and Frederick P. Stearns, to formulate plans for the improvement and extension of the existing system of sewers in the District.

After a careful and thorough study of the problems involved, the Board has submitted its report.* The subject investigated appears to include somewhat unusual and difficult conditions. As in several others of our large cities, the sewers have gradually increased in number and magnitude (252.2 miles having been built), without any comprehensive plan having been adopted. Outlets which at first were unobjectionable, from the moderate amount of sewage discharged, with the great increase of population and consequent extension of the sewer have become sources of great offense, and even of danger to health. Large outlet sewers have been built, involving the expenditure of much money, and these have intensified, instead of improved, this condition of things; and, above all, a large area exists in the center of the city, a considerable portion of which is closely built up, which, from its slight elevation above tide, is exposed to flooding from freshets in the river — having, three times during the past thirteen years, been covered with water to the depth of several feet.

The report is divided into five parts. The first is introductory, giving a general idea of the topography of the city of Washington; a concise statement of what has been done up to the present time to provide for the discharge of the sewage, with an account of the nuisances thus created, and description of the main outlet sewers; a summary of the different suggestions and schemes proposed for improving the sewerage system; and an account of Captain G. W. Symons' plan for the reclamation of the central low district, which has been so frequently devastated by floods, by elevating the streets, alleys and reservations, one foot or more above the maximum height yet attained by any freshet in the Potomac.

In Part II. the final disposition of the sewage of the city is taken up and discussed. Speaking first of the fundamental necessity of directly or indirectly purifying the sewage, the report says:

> "The purification of sewage is accomplished by an oxidation of its organic substances through the agency of microbes in the presence of a sufficient supply of oxygen. In practice it can be brought about by allowing the sewage to percolate intermittently through a porous soil, or by highly diluting it with water. In both cases the necessary oxygen can be supplied from the air contained in the interstices of the soil or dissolved in the water. The bacterial work in converting the organic into inorganic matter is comparatively slow, particularly where sewage is turned into a body of water, as the quantity of oxygen required is large. Therefore, a considerable amount of land or very large quantities of water are respectively required. The solid particles containing less than half of the organic matter can, however, be removed more rapidly either by subsidence, by mechanical straining, or by chemical precipitation, leaving the sewage in a condition to require much less land or water for a final purification. The available opportunities and conditionss for purifying the sewage in each particular locality will, therefore, indicate the proper way by which it should be accomplished."

A partial purification of the sewage by subsidence or chemical treatment is disposed of not only as being quite expensive both in first cost and in annual expense, but also as being unnecessary in this particular case; more complete purification, by intermittent filtration or broad irrigation, is equally unnecessary, and is also unattainable within a reasonable distance of Washington on account of the lack of a sufficient quantity of suitable land.

The remaining method of discharging the sewage directly into the Potomac, the sand and other heavy substances being removed by subsidence, and the coarse floating substances intercepted by screens, is the one recommended.

From the best data attainable the ordinary low water flow of the Potomac is taken at 2,300 cubic feet per second, it being considered that the occasions at which the discharge may be much less will be at such infrequent intervals, and of such short duration, that no serious harm will then result from less dilution of the sewage than would be given by the above assumption. Various authorities, it is stated, have concluded that a flow of from 1.5 to 3.3 cubic feet of water per second will sufficiently dilute the sewage of 1,000 people. This, at the ordinary low water flow, would provide for a population of from 690,000 to 1,567,000. Even at the rate of 4 cubic feet per second per 1,000 inhabitants, recommended for Chicago, with its large amount of sewage from stock yards and slaughter houses—very different from the conditions prevailing or likely to prevail in Washington—the Potomac at its ordinary low stage would provide for 575,000 people. The opinion is given by the Board that the Potomac will dispose of the sewage of a population of at least 800,000 without causing offense "provided the sewage is mixed uniformly with the whole volume of water discharged by the river."

Three different points of outlet for the sewage, all in the Potomac, are considered: (1) Near Easby's Point. (2) Above the Eastern Branch opposite Gravelly Point. (3) Below the Eastern Branch, at the first projecting point above the Naval Magazine.

While estimates are given for projects discharging a portion or all of the sewage at each of these points, the project with the third point of outlet is the one recommended, on account of the much more rapid and complete diffusion of the sewage that will take place there, due to the much greater volume of water passing both during ebb and flood tides in low stages of the river (ten times as much as at Easby's Point), and the short period of slack water at turn of tide, and also on account of its being so far below the city as to prevent the return of the sewage on the flood tide.

The outlet opposite Gravelly Point is next in order of merit, and the one at Easby's Point the least desirable of all.

Part III. treats of the protection of the low district from floods, which though not specifically included in the problem submitted to the Board, yet has so many features in common with those required for flood prevention that it was deemed necessary to consider them jointly. The project of Captain Symons only includes raising the public streets, alleys and reservations to the requisite height, and replacing the public property in the same condition as before, including the improvement of the quality of some of the pavements. For this he estimates the cost to be $2,020,694.05. The cost of raising private buildings, tracks and other structures in the streets belonging to private corporations is not included, and these items, together with the cost of additional large sewers for storm water, the Board estimates, would probably swell the total cost to $5,000,000 This is one-third more than their estimate for the total cost of the proposed system of sewerage including the protection of the low district from floods. There is, moreover, no certainty that future freshets may not rise a foot or two higher and still flood this portion of the city after it has been raised.

In place of thus elevating the grade of the streets, it is proposed to construct a dike or levee at one end of the low district, from Virginia Avenue to the Monument grounds, and a second one at the other end across the valley of the James Creek Canal at N Street, both of them to have an elevation of six feet above the highest freshet line. High level sewers will be built to intercept all the storm water possible from the adjacent high lands, so as to diminish the amount to be cared for in the low district. A large trunk sewer will receive both sewage and storm water from this area and deliver them at the pumping station at the foot of New Jersey Avenue, on the Eastern Branch. Heavy rainfalls will discharge by gravity into the Eastern Branch at ordinary stages of the river. Light rainfalls will be pumped up and delivered with the rest of the sewage to the Naval Magazine outlet; and during high stages of the river all storm water will have to be pumped up, delivering heavy rainfalls directly into the Eastern Branch. The existing sewer on B Street it is proposed to utilize for discharging the comparatively pure storm water from the adjacent parks into the tidal basin during heavy rains.

Part IV. discusses the questions of the future population of the district, the amount of sewage requiring removal, the amount of storm water to provide for in proportioning the sizes of the storm water interceptors, and the form, material and minimum velocities assumed for the proposed sewers. It also gives a general description of the five different projects for which estimates have been made.

The future growth of the district was difficult to estimate on account of the abnormal increase of population during the war period—in the decade 1860 to 1870—since which time only two censuses of the United States (1870 and 1880) were available. The police censuses of 1885 and 1888 being taken with less care, could not be given the same weight. In forecasting the future growth it was preferred, therefore, to seek probable maximum and minimum curves rather than a single one, as usual. From these the Board gives as its judgment that it is sufficient to provide, in the proposed sewage works, for a population of 500,000.

The water consumption of Washington being unusually large, the sewage flow, including the ground water entering the sewer, is taken at 20 cubic feet per individual per day; and the intercepting sewers for carrying sewage are proportioned to carry this quantity when running half full. This is deemed sufficient to provide for a small amount of rain-water and the moderate fluctuation in the hourly consumption of water, the maximum being 14½ per cent. greater than the mean.

Much attention has been given to the subject of maximum rainfalls and amount of storm water reaching sewers. To assist in the determination of this point, tables and diagrams were prepared giving the amount of rainfall, duration and rate per hour of the maximum rainfalls for several years past in Boston, Providence, New York, Philadelphia and Washington.

The estimates for the five different projects considered are as follows:

No. of Project.	Main Outfalls.	Total Cost.	Cost of Interest and Depreciation.	Cost of Pumping and Maintenance.	Total Annual Cost.
I.	Near Naval Magazine....	$3,598,003	$143,920	$19,920	$163,840
II.	Opposite Gravelly Point..	3,343,002	133,756	19,920	153,676
III.	Four-tenths near Easby's Point and six-tenths opposite Gravelly Point....	3,393,825	135,753	11,474	147,227
IV.	Two-thirds near Easby's Point and one-third opposite Gravelly Point...	3,205,676	131,827	11,474	143,301
V.	Opposite Gravelly Point...	3,873,671	154,947	11,474	166,421

The first project, which is the one recommended, contemplates the construction of three high-level intercepting sewers for storm water and sewage (which will deliver their storm water respectively at Easby's Point, in the Washington channel at M Street, and in the Eastern Branch at the foot of New Jersey Avenue), besides the trunk sewer in the low district already mentioned. Three low-level interceptors, for sewage, will also be provided, to intercept the sewage from all local sewers now existing, or to be built in the future and also from the high-level interceptors above mentioned. These will discharge their contents into the trunk sewer, which, in its turn, will deliver the sewage of the whole city (excepting a part of Georgetown, which, it was considered, could continue to deliver its small amount of sewage directly into the Potomac) to the pumping station on the banks of the Eastern Branch. Here, after removing the heavy matters by settling tanks and the coarse floating matter by screens, the sewage will be pumped up to a sufficient height to enable it to flow by gravity through a triple line of 48-inch cast-iron syphons under the Eastern Branch, thence through a brick outfall sewer to the banks of the Potomac near the Naval Magazine, and finally through two 48-inch outlet pipes to the edge of the channel, about 500 feet from shore.

An appendix gives a detailed description of this project and of the pumping station, centrifugal pumps being recommended for lifting the sewage. Detailed estimates are given of the cost of the five different projects, the tables of rainfall already mentioned, etc. Twelve plates accompany the report, including a map of the city of Washington, showing the present main sewerage and sewage outfalls and territory flooded in June, 1889; sketches showing movement of sewage discharged, and comparative dispersion at the different outfalls; diagrams of growth of population in different American cities, with estimated curve for future growth of Washington; diagrams of maximum rainfalls in several cities; curve showing amount of rain water assumed to reach sewers for the conditions prevailing in Washington; plan and profiles of the recommended project for a system of sewerage and drainage for the district, and a sketch plan of the proposed pumping station and accessory works.

The report is one upon which the members of the Board have evidently expended much thought and study, and is a valuable contribution to the literature of sanitary engineering.

(To be continued.)

At Sheffield, England, of which an English paper speaks as one of the smokiest towns in the world, the smoke prevention question is being vigorously agitated.

The Pittsburg *Commercial Gazette* complains that street railway franchises in that city are free as air, and that, in consequence, large sums of money are lost to the city.

THE FILTRATION OF NATURAL WATERS.*

In the study of the subject of filtration of water for drinking purposes, we shall arrive at no clear and valuable ideas unless we distinguish sharply between mechanical filtration, which deals only with the interception and retention in the filter of the solid particles suspended in the water, and filtration combined with the oxidation of organic matter, that in solution, as well as that in suspension in the water. This latter process—the purification of the water by the oxidation of its organic contents—can be accomplished only by *intermittent* filtration, the former—the mere removal of the solid particles in the water—may be accomplished by *continuous* filtration, as practiced in many large cities in Europe.

When we speak of the purification of water by filtration, we mean in a general way that a water is thereby rendered fit to drink which was unfit or unattractive before it was filtered. The change effected by filtration may be simply the removal of vegetable or earthy matters, whereby the water is made more palatable and more attractive in appearance, or it may be more radical in converting water which was positively harmful into a good drinking water. Widely different in action as are the two systems of filtration, the intermittent and the continuous, yet it is possible by both systems to improve the quality of a bad water.

In the system of continuous filtration, in which there is little or no change made in the dissolved organic matter, it might at first thought seem as if there could be only imperfect purification; but it must be borne in mind that it is possible in this system to remove in great part even those very minute organisms, the bacteria.

The germ theory of disease furnishes us with the simplest explanation of the way in which water does harm, and if we can, by simple mechanical filtration, remove the harmful germs from the water, we have effected a true and efficient purification of that water, whatever may be its chemical composition.

When water is said to be well, or moderately well, or completely purified by filtration we cannot know what is meant unless we know what is the standard of purity implied. Is it simply the removal of color, odor and suspended matter; is it chemical purity, meaning thereby the absence of unoxidized organic matter; or is it bacterial purity, or freedom from germs? Again, what shall we say of water of high chemical purity, with high bacterial contents; or what of a water with few or no bacteria which contains considerable organic matter capable of undergoing change?

Intermittent filtration is capable of giving water free from organic matter and free from germs; continuous filtration, if conducted very slowly, is capable of giving water free from bacteria, without odor and color, but which may contain much dissolved organic matter. Intermittent filtration effects the oxidation of the organic matter in solution as well as that in suspension; continuous filtration has little or no effect on the organic matter in solution.

After laying such stress on the removal from water of bacteria, it sounds like a paradox to say that purification both by intermittent and continuous filtration depends on the presence in the filter of bacteria in enormous number, and that without them the purification would in both cases be impossible.

The idea is not a new one that the bacteria of decomposition are benign and useful organisms which break up organic matter, rearrange its atoms and convert it into mineral matter so that it may again serve as food for plants. If we keep away the bacteria from a mass of dead organic matter it undergoes no change whatever. All processes of decay of organic matter are absolutely dependent on the presence of these micro-organisms, which, so far as we know, have no other than a beneficent role to play in nature. I say this is now a matter of common knowledge and one is therefore not unprepared to hear, that in the purification of water by intermittent filtration the ground or sand upon which the water is poured is full of bacteria, in fact, that it is the design of the process to cultivate them and have as many of the micro-organisms in a cubic inch of ground as possible.

If one pours over a column of clean, bright, sand, free from bacteria, impure water, as sewage, it will flow out about as bad as it entered the sand. But if it is poured over a column of sand in which septic bacteria have been cultivated, so that the sand may be said to be fairly reeking with bacteria by the million, the water may flow out as pure (organically) as spring water.

Sewage is a substance which contains all of its nitrogen in the unoxidized form. Its principal ingredient is free ammonia; it also contains considerable organic nitrogen, or albuminoid ammonia, but of nitrous or nitric acid it contains none. When sewage is exposed to the air in mass, oxidation goes on very slowly, because it can only get air from its surface; when it flows out into streams, the oxygen dissolved in the water of the streams quickly oxidizes the ammonia. When the sewage is exposed to the air in very thin layers, as when a porous material like sand is moistened with it, oxidation goes on with great rapidity. It was until recently considered that this oxidation was a direct chemical combination of the elements of the organic matter with the oxygen of the air, or the oxygen dissolved in the water, but we now know that nitrogen is not oxidized by the direct contact of decomposing nitrogenous matters with air, unless bacteria are present, and the inference seems a fair one that the greater the number of bacteria the more rapid the process of oxidation. Sewage itself usually contains hundreds of thousands of bacteria to the cubic centimeter which are dormant until air gets access to it. If sewage is preserved out of contact of air, the bacteria of decomposition will in time all die.

The experiments of the Massachusetts State Board of Health on the purification of sewage by intermittent filtration which have been carried on at Lawrence for the past two years, under the direction of Mr. Hiram F. Mills, the engineer member of the Board, have added largely to our knowledge of the conditions governing the purification of nitrogenous organic matter. Here are large tanks, $\frac{1}{200}$ of an acre in surface, filled with different materials—coarse sand, fine sand, river silt, muck, garden soil, clay, etc., to the depth of 5 feet, on which is poured from day to day sewage in known amount and of known composition. The effluent water from this sewage filtration is collected, measured and analysed and the precise amount of purification determined. The result of two years' work at this station will shortly be published in the Report of the Board now in press. I will at present give one or two of the facts that have been there developed. The purification of the sewage means the complete oxidation of all its organic ingredients both in solution and in suspension—the carbon to carbonic acid, the hydrogen to water, and the nitrogen to nitric acid. The filtering materials best adapted to the purpose are those which are fine enough to retain considerable sewage in their pores and also plenty of air at the same time.

---

* Part I., General Description and Elliptical Ceiling was published April 12.

* From a paper by Thomas M. Drown before the Boston Society of Civil Engineers, published in the *Journal* of the Association of Engineering Societies.

The body of porous material is, when in good working order, a very delicate machine. It must be coaxed up to its highest efficiency by gradually increasing the amount of sewage. This means, in all probability, that we must develop in the pores of the sand an immense number of bacteria to be constantly on hand in the different layers to attend to the sewage as it reaches them. During the first winter there was no nitrification in these tanks, and, consequently, no perfect purification, but on the advent of spring, when the temperature of the effluent water reached 39° Fahr. nitrification began and has continued ever since, the cold weather of the second winter failing to stop it.

The tank which has given the best results, that is, a good purification of the largest quantity of sewage for a long period, is filled with coarse mortar sand, most of the grains of which average about 0.06 inch in diameter. This has given an effluent day after day organically as pure as many drinking waters, when receiving sewage at the rate of nearly 60,000 gallons per acre per day.

One would naturally ask why is not this the ideal system of purification of all surface waters, even those that are not polluted by drainage of any kind but which contain much vegetable suspended matter, and have, in consequence, sometimes, a bad odor; or waters which are unattractive in appearance by reason of dissolved coloring matter?

One of the tanks of the Lawrence Experiment Station has filtered Merrimack water intermittently for more than two years at the rate of 300,000 gallons per acre per day. The filtering material consists of 3 feet 8 inches of coarse and fine sand and fine gravel; 10 inches of yellow sandy loam, and 6 inches of brown soil in the same position as found on the river bank. During the day the surface of the sand is generally covered with a few inches of water, but at night and on Sunday air gets excess to the sand.

The water is free from microscopic organisms, and the bacteria rarely exceed 10 or 20 per cubic centimeter, while the water applied has generally a few hundred. During the two years that this tank has been in operation the surface has not been cleaned or disturbed in any way. The slow rate of filtration (being only about one-half an inch an hour per square foot of surface) is due to the considerable amount of very fine material contained in the soil and loam.

But one must bear in mind, in connection with the rate of filtration, that the thoroughness of the purification, meaning thereby the oxidation of the organic matter, is much greater in intermittent than in continuous filtration.

This system of intermittent filtration for natural waters has never, I believe, been carried out on the large scale, although the possibility of its being practicable in some localities has been discussed. It is the system that nature suggests, for it is intermittent filtration which supplies the springs which furnish the ideally pure and perfect drinking water. With intermittent filtration the deposit of organic matter in the pores of the sand would dry out or become oxidized when the ground was more or less dry.

It has been to many a difficult matter to explain how filters working continuously, and constantly covered with water, could intercept objects so much smaller than the spaces between the particles of sand. It was easy to imagine that some of the minute suspended particles might be caught between the particles of sand, but that practically all the suspended matter, even the minute bacteria, could be removed in a good-working filter, seemed to indicate that the efficient working of a filter depended on the fact that it became nearly clogged on the surface by the algæ and other matter which held back even the smallest objects. But if this were the case it would save time to use a finer sand at the outset, which experiment shows will not accomplish the purpose.

Piefke has given us the clearest conception of the action of sand filters in removing the suspended matters, including bacteria, from surface waters. The chemical effect is very slight, as might be supposed when one reflects that the duration of the passage of the water through the sand seldom, if ever, exceeds 5½ hours, and, since the filter is kept constantly covered, there is no oxygen present but that dissolved in the water. But the mechanical effect in removing suspended matter—mineral and organic—is very great. The Spree water, which forms part of the supply of Berlin, contains as high as 100,000 bacteria per cubic centimeter at times, and the number in the filtered water rarely exceeds 100, that is, the reduction of bacteria may reach 99.9 per cent. The thickness of the sand layer is generally from 2 feet to 3 feet, and this rests on a layer of coarser gravel, which is without any effect on the filtration. The size of the sand is seldom finer than one-fiftieth of an inch, which leaves channels between the grains that 500 micro-organisms could pass abreast. Smaller still are the particles of clay which give a milkiness to water, and yet when one of these sand filters is working well, both clay and bacteria are held back in the sand. It takes a new filter about two weeks to get to its maximum efficiency, and if the sand be first carefully cleaned and sterilized by heat, then it takes much longer, many weeks, before the filter works well.

On examining with the microscope the surfaces of the particles of sand when the filter is in perfect working order, they are found to be coated with a greasy, slimy substance, which is a mass of bacteria jelly. It is to this coating of bacteria jelly that Piefke attributes the efficiency of these filters, and until the jelly forms in sufficient amount to completely envelope each particle of sand, the filters work imperfectly. This then is his explanation of the fact that minute micro-organisms and particles of clay of infinitely smaller size than the channels in the sand are stopped in their passage through it—they are simply caught in this slimy coating and cannot get further.

A filter of this kind is, like that used in intermittent filtration, a very delicate instrument and it is very easy to disarrange it. Disturbance of the sand or suddenly increasing the pressure of the water may have, as a consequence, a rush of bacteria into the filtered water. Quite regular working is an essential condition of success. The rate of filtration is on an average only four inches vertically an hour, so that in the passage of the water through the sand, one-third of which is interstitial space, its rate is three times as great, or 12 inches an hour, and the sand layer being two feet thick, the water is in contact with the sand only two hours. In very turbid waters or waters very high in bacteria the filtration is often decreased to one-half this rate or even less, and in comparatively clear water, with low bacteria, the rate may be doubled. The working of the filters in Berlin is governed entirely by the number of the bacteria in the filtered water, this being the

simplest way of judging of the efficiency of their working. One hundred bacteria per cubic centimeter in the filtered water is considered a good result on the Spree water, which contains always many thousands To give practically sterile water would require a diminished rate, say to one vertical inch an hour, which would be impracticable without enlarging the filtering plant.

The surface waters used to supply London from the Thames or the Lee are filtered by the method of continuous filtration, a surface of 100 acres being required for the purpose. The thickness of sand differs with the different companies supplying the city with water, from two feet at the East London and Grand Junction Companies to four and a half feet at the Chelsea Company, and the rate of filtration per hour, in imperial gallons per square foot of filtering surface, is two and one-sixth with the Lambeth Company, to two and one-half gallons with the Southwark and Vauxhall Company. Two and one-half gallons, or five vertical inches an hour (which is seldom attained) is considered the maximum consistent with good clarification. Complete analyses are made of the water supplied to the metropolis by the different companies. Some of the determinations, as for instance, color, and the amount of permanganate to oxidize the organic matter, are made daily, other chemical determinations are made weekly.

The only filtering plant in this country, that I know of, which at all compares with the plants in Europe is that at Poughkeepsie where the Hudson River water is converted into good clear water, though not absolutely free from color. Mr. Fowler, the superintendent of the works, writes me with regard to the details of the filtration: "Our usual rate of filtration is about six inches per hour, vertically, and this we regard as the maximum of efficiency, although we can sometimes do good work, so far as clarifying is concerned, at double that rate, and at other times are unable to do good work at one-half that rate, although the latter condition is exceptional. Very much depends upon the condition of the water in the river. The depth of water on the sand varies from one to three or four feet, and the difference of level between the surface of the water on the beds and that in the intermediate basins is usually two to four or five feet."

The rapid filtration of water through coarse gravel is not unfrequently carried out at water-works to remove the larger particles floating in the water. When a filter of this kind is cleaned it is surprising to see the amount of fine dirt of all kinds that has been intercepted by the coarse material. Filters of this character do not pretend to purify the water in the sense of removing bacteria or in oxidizing the organic matter, but they are useful just to the extent to which they clarify the water and thereby improve its appearance.

The American system of filtering large quantities of water may be said to be the mechanical filters working under pressure. These filters are composed of 4 or 5 feet of moderately fine sand (some have also a mixture of coke) inclosed generally in boiler iron cases. They work with tremendous rapidity, sometimes over a 100 vertical feet an hour, but 40 feet is said by some to be the highest rate consistent with good filtration. In this system alum is generally added to the water as a coagulent. Its effect in very small amount is quite remarkable—say a grain to a gallon or even less—in retaining the solid matters of the water in the sand of the filter. The alum is decomposed by the carbonates in the water and hydrate of alumina is precipitated. This is a gelatinous and slimy substance, and immediately surrounds the algæ, clay and anything else that may be suspended in the water, and the sand retains this coagulated mass. Alumina has also the effect of taking the color out of water, so that clear, colorless water may be obtained by this process from swampy waters full of growing algæ, with almost incredible rapidity.

These filters are in very general use in paper mills and other industrial works where a clear colorless water is needed, and where a colored turbid river water is the only natural supply available. They have also been introduced into some cities of considerable size as, for instance, Long Branch, Chattanooga and Atlanta, and they are said to give water that is satisfactory to those who use it. The objection to the system is the use of alum. If all the alum used were decomposed in the few seconds that it takes the water to pass through the filter, so that no undecomposed alum passed into the filtered water, there might be no objection to its use, but this is not always the case. The amount of alum used is ordinarily small, and it is claimed that if it even all went into the filtered water it would not injure it for drinking. This may be so, but the prejudice that exists against drinking water which has been treated with "chemicals" is so strong that it is not likely that any system using a coagulent in a soluble form will find general acceptance. Under some conditions, when the water has high color with much suspended matter, the alum has to be increased largely to give good results. I have known as high as 17 grains to the gallon to be used with a very bad swampy water.

In this connection should be mentioned the spongy iron filter of Bischof, which gives most excellent results both in taking out suspended matters from the water, including the bacteria, and also decreases the hardness of the water. This filter has been used on the small scale in houses, and also on the large scale in Antwerp to decolorize and otherwise purify the water of that city. The filter is composed of finely divided metallic iron made by reducing iron ore by means of carbon at a temperature below fusion. Its action was not understood for a long time, and the mystery that surrounds it was an additional recommendation for it. The rationale of its working seems to be this, namely, that the iron being in a very finely divided state is dissolved to a slight extent by the combined action of the oxygen and carbonic acid in the water, and the ferrous carbonate thus produced is further oxidized, forming hydrate of iron, and then this acts as a coagulent just as the alumina hydrate does. The system was said to be too expensive on a large scale, and it has now been replaced at Antwerp by the Anderson process in which the dark water is made to pass through a long revolving iron cylinder in which there is a large quantity of fragments of cast-iron. These fragments of iron in their friction one on the other are abraded, minute particles are broken off, which are dissolved in the way above described. The water coming from the revolving cylinder is exposed to the air, the iron oxidizes and precipitates, combines with the coloring matter in the water, incloses the solid particles, and is then filtered out through sand. The process is said to work satisfactorily and give clear colorless water. There is no objection to this use of iron as a coagulent provided that it is all oxidized and precipitated, and none is carried in solution into the filtered water; but this takes time.

Both alum and iron salts have a tendency to sterilize water. Their action may be both direct by killing the bacteria, and indirect by removing them with the precipitated alumina or iron hydrate. If a drop of a solution of alum, or of iron chloride be added to a gallon of turbid water, it will become perfectly clear in the course of a few hours, the alumina, or iron hydrate, which is formed in the water, settling to the bottom and carrying all the suspended matters with them. It has been proposed to clarify Mississippi water by adding a very small quantity of an iron solution to the water in the settling basins.

Correspondence.

Communications giving information or opinions on matters of general interest to the engineer, the architect, the contractor, or the municipal officer, will be welcomed in this column. Fairness will suggest that when communications are sent simultaneously to this and other journals we should be informed of it at the time. Anonymous letters will not be noticed.

THE SECRETARYSHIP OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS.

BROOKLYN, November 12, 1890.

To the Editor of THE ENGINEERING RECORD.

SIR: The Nominating Committee of the American Society of Civil Engineers has recently submitted a list of offices to be balloted for at the annual meeting, among which is that of a non-resident associate for secretary.

This nomination conflicts with the organic law of the society. Its constitution divides the membership, with regard to location, into two classes; those who reside within 50 miles of New York City being resident, and all others being non-resident. It confers upon associates all of the privileges of membership except the right of voting; it makes the secretary a director, who is a trustee under the act of incorporation and the laws of New York State, upon whom, with his colleagues, devolves the management of the society's affairs (requiring him to vote, which an associate may not do), and it prescribes that of those named for offices by the Nominating Committee, one vice-president, three directors, the secretary and treasurer, shall be resident members.

The nomination is inconsistent with the usages and policy of the society up to the present time. Those active in its councils and familiar with its history have heretofore uniformly held that its officers should be elected from its resident membership. The nomination is also contrary to precedent. The first Nominating Committee first named for secretary a non-resident member, and afterwards substituted a resident member, who was elected and has served since.

It would seem that of all classes of men engineers should be strictly obedient to law, particularly that of their own making. In his practice and of his standing among his professional brethren, the crucial test is his interpretation of "what is written" in contract or what is understood by agreement between those with whom he has to do, and his decision thereon without fear or favor. "Mr. Fisher," said the president of a leading railway to his chief engineer, "Why are you regardless of your own interests?" "In what particular," was inquired. "You take the part of contractors against the railroad." "Do not you know," was the reply, "that in my position I have always to determine that which is right and just between the parties?" Those whose good fortune it was to know the chief engineer never doubted that he did this faithfully and well.

It is said that now to the members will be given the opportunity of voting in favor of the policy (*first*) that "the secretary shall be one not practicing as civil engineer;" and (*second*) who will give "his entire time and effort to the society and the furtherance of its interests." Waiving the contention that the irregularity of the pending nomination renders it void, it is difficult to see how any decision upon the *first* proposition may be had at the present time unless two candidates are offered for ballot, each understood to represent the one or other diverse view as to the grade of membership from which the secretary shall be chosen. The result as to the *second* proposition will also be indefinite. Without action by the society before the annual meeting otherwise determining the secretary may continue to accept other engagements, and to devote thereto such of his time and energy as may to him seem right, having due regard for the interests, personal to himself and accruing to his benefit, with which every true man is charged.

Whatever unfavorable criticism of this practice heretofore has been made, no matter how intended, has really not been of the secretary, but of the society itself, because of its peculiar conception of the position of its chief executive officer. Formerly the secretary received $3,000 per year, out of which he paid his assistants—a plan which ingeniously lessened his own compensation, as by his faithfulness and efficiency he increased the measure of service to be rendered. Now he is paid the full sum and permitted to occupy a part of the society's house not otherwise used. Such, heretofore, has been the gauge of value by the society of the important and exacting duties discharged by a leading member. Is it strange that non-professional men fail to duly appreciate an engineer's worth and standing?

Generally there is more or less complaint that the society does not, in the public mind, take the rank or exert the influence which it should. Its publications, issued at irregular intervals and long after the date they bear, fail to keep the membership promptly informed of the advances made in professional knowledge and of the transaction of the society's business. In quality of matter *and typographical style* they are surpassed by some of those of kindred associations. Its library, rich as it is in rare and valuable material for study and reference, is consulted with difficulty by those who visit it, and to all others its treasures are practically inaccessible.

The efficiency of the requisite measures to enhance the worth, influence and strength of the society depend greatly upon the secretary. His powers should be amplified and increased; his duties enlarged and definite; his responsibility, clear and undivided; and, last but not least, he should be generously sustained and supported by the membership. His whole time and energy should be devoted to the service of the society, it being understood that during the official term he shall not accept other permanent engagement; for which his salary should be that of a chief engineer, and not less than $5,000 per year.

Whoever fills this office should also possess abundant theoretical and practical knowledge due to a thorough training and a wide experience in the practice of engineering, together with those personal qualities which fit him to shape the opinions and direct the consequent action of those associated with him. In brief, he should either be the incumbent if he will longer serve, or one so nearly like him as the society may fortunately elect.

G. LEVERICH.

[Editorial reference to this letter is made in another column.]

DISPOSAL OF PUBLIC SEWAGE.

DR. BENJAMIN D. LEE, Secretary of the Pennsylvania State Board of Health, has issued a circular on "The Disposal of Sewage of Public Places." The general tendency is to conduct the sewage of all large institutions into large streams, polluting them and making this one of the most urgent problems with which the sanitarian has to deal.

The city of Philadelphia was enjoined recently against the use of a small stream into which a sewer emptied and contaminated the water which had been clear prior to the introduction of the conduit.

Secretary Lee, in arguing upon the question, says:

"It is evident that if a city, which possesses the right of eminent domain, and is, by the terms of its charter, especially authorized to construct sewers, can be enjoined from discharging its filth into a small stream running through private property, so much the more can a hotel, school, hospital or jail.

"This matter is forcing itself upon the attention of borough authorities, hotel proprietors, mill owners, and other employers of large bodies of operatives throughout the entire commonwealth.

"The State Board of Health is especially desirous that all State establishments, such as asylums, hospitals, colleges and schools and all county institutions, such as jails and almshouses, which derive a portion, if not all of their support, from the public funds, and which are generally looked upon as models by the communities in the midst of which they are placed, should set the example to municipalities and private individuals of making proper provision for the purification of their sewage before it is permitted to enter any stream. The Board, therefore, earnestly represents to the trustees or other responsible heads of all such institutions the seriousness of this growing evil, urging that no time be lost in remedying any offensive and dangerous conditions which may be found to exist."

"MODERN RURAL HOMES" for September, October and November, 1890, published by the National Architects' Union, Philadelphia, Pa., contains, like the earlier edition, a number of suggestions for country houses in the shape of perspective views and plans, with brief descriptive particulars. The latter explain more clearly, than do the plans to the non-professional reader, the main details of the dwellings considered, and refer to the natur of the material to be employed, proposed methods of heating, etc.

DOMESTIC PLUMBING HEATING LIGHTING & VENTILATION ENGINEERING

ELECTRIC MOTORS.

(Continued from page 382.)

THE THONE MOTOR.

THE Thone Motor is built by the Hawkeye Electric Manufacturing Company, of Davenport, Ia. The most characteristic feature of the motor is its field magnets and the armature. The field magnets consist of two heavy and powerful horse-shoe magnets, of a form corresponding with the natural lines of force and terminating with their like poles in a massive pole-piece. There are no abrupt corners.

The motors are used for various kinds of work. When the motors are to run at a constant speed, the plain shunt winding is used. They are also made for speeds which require a maximum and minimum—such, for instance, as ice cream freezers, coal mining hoists—in fact, where various speeds are required. The method of regulating the speed for this kind of work is simple and positive in its action. The armature is of the well-known Gramme type. The core is built up of soft charcoal-annealed iron wire, laid in sections on a true drum, which is securely fastened to the shaft. The shaft is of steel, and runs in bronze bearings, firmly bolted to the pole pieces. The commutator segments are of drop forged copper, insulated with mica between the segments, as well as under the heads.

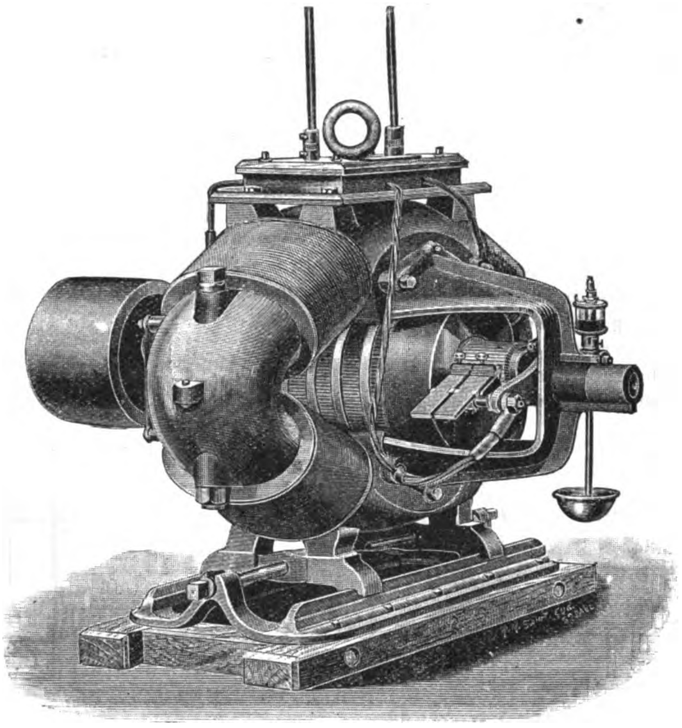

FIG. 27.—GENERAL VIEW.

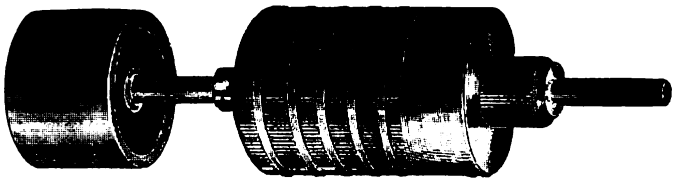

FIG. 28.—ARMATURE AND COMMUTATOR.

THE THONE MOTOR.

The motors are manufactured in sizes from ½ to 100 horse-power. Figure 27 represents a general view, and Fig. 28 shows the armature and commutator complete.

THE PERRET MOTOR.

The Perret motor, made by the Elektron Manufacturing Co., 79–81 Washington Street, Brooklyn, N. Y., is illustrated by Figs. 29, 30, and 31.

The chief distinctive feature of the Perret machines is the lamination of the field magnet. Instead of casting or forging this in several solid pieces, as is usually done, it is built out of thin plates of soft charcoal iron, which are stamped directly to their finished form and clamped together by bolts in such a manner as to secure great mechanical strength. The advantages of such a construction are claimed to be a magnetic field of much greater intensity than can be obtained otherwise, and the prevention of all wasteful induced currents in magnets and pole pieces. The armature core is also laminated, and the plates have teeth, which form longitudinal channels on its periphery in which the coils are wound. The plates in both field and armature are in the same plane, and are of soft charcoal iron, with its grain running in the direction of the line of magnetic force, and there is no air gap between the iron of the field and the iron teeth of armature, except that required for clearance in rotation. The armature coils being practically imbedded in the armature are claimed to receive the highest inductive effect from the magnetized iron

The Perret motors are all of the slow-speed type, running, it is claimed, at less than half the speed of many other motors of equal power and weight. The advantage of this is pointed out to be less rapid deterioration, and the absence of expensive gearing. The regulation of the motors is entirely automatic, freedom from sparking at the commutators is claimed, and the mechanical details are said to be well worked out.

Figure 29 shows the form of two-pole motor used for from ¼ to 2 horse-power. Figure 30 represents an end view of a motor of the multipolar type. This pattern has been adopted by the company for all sizes above 2 horse-power. Figure 31 is a diagram showing the magnetic circuit, the dotted lines representing the direction of the lines of force.

The Perret motors are made in sizes from $\frac{1}{12}$ horse-power up to 20 horse-power.

(TO BE CONTINUED.)

THE PERRET MOTOR.

STEAM HEATING FOR PASSENGER CARS ON THE PENNSYLVANIA RAILROAD.

A DESCRIPTION of the passenger car steam heating system with which the Pennsylvania Railroad has been experimenting is given by Theodore N. Ely, of Altoona, Pa., in the November number of the *Journal* of the Franklin Institute.

Mr. Ely states that the Pennsylvania Company's experiments have confirmed their belief that the return system is the one which must finally prevail if the best results are desired.

A return system, he explains, is one which, by the aid of a pump or other vacuum producing device, brings back to the tender of the locomotive the water of condensation derived from the steam which has given up its heat in warming the cars.

In the Pennsylvania Railroad system, as shown in the accompanying illustration, an ordinary pump is used as a means of obtaining the necessary vacuum, and is located conveniently on the inside of the tender.

The steam to supply the system is taken from the bridge pipe X of the locomotive and passes into a reducing valve, R, where the pressure is reduced to about 40 pounds; it then crosses over to the tender by means of a hose pipe, and enters a second reducing valve. The first of these valves is set to protect the hose pipe, the latter to protect the train from extreme pressure.

Before the steam enters this second reducing valve a branch is taken off to drive the pump P, and on the other side of the valve, the exhaust steam from the pump connects so that this steam may be turned in to heat the train.

Leaving the second reducing valve the supply pipe runs to the back of the tender and here crosses over and connects with the main supply pipe S under the car. This pipe runs the entire length of the car and connects to the next car, and so on, forming, when the train is coupled up, a supply pipe running the entire length of the train.

In the center of each car a branch leaves the main pipe to supply the car with steam. At this point a three-way cock, C, is placed on the main pipe and arranged so as to allow the steam to flow along the main pipe and into the branch at the same time; this is the same in all of the cars, except the last, where it is turned in such a position as to allow the steam to flow into the branch pipe only, further communication back of this on the main pipe being cut off. This cock is operated from the inside of the car and obviates the necessity of placing a cock at each end of the pipe, which cock when closed, as in the case of the rear of the last car, forms a pocket in which the condensed water may freeze. The main pipes leading through this three-way cock have a pitch to either end, and are so arranged that when uncoupled they will drain themselves. This branch pipe conducts the steam to a reversing valve, V, which will be explained later on. By means of this the steam is distributed to both sides of the car, the two pipes conveying this steam coming up through the floor on opposite sides of the car and connecting with regulating valves D, placed to control the heat; these two valves stand, one on either side of the aisle under the center of the seats, and are easily operated without disturbing passengers.

The arrangement of radiators H, pipes, etc., inside the car on both sides are exactly the same, both sides being operated independently, so that in case of a leak it is only necessary to shut the steam off one side.

The regulating valve is the highest point reached, the pipes being so arranged that any condensed water that may accumulate will find its way out when the cars become uncoupled. From the regulating valve, the steam is conducted by a ¾-inch pipe to the radiators, which are located in the corners of the car, and from them back to the center, by means of a cast-iron radiator pipe B, two inches wide, four inches high, with radiating ribs one inch apart; these pipes are bolted together in lengths of about six feet.

In the center length of the cast-iron pipe, the exit for the condensed water is placed. This is a foot lower than the regulating valve, so arranged that all the water condensed in the radiators, etc., will find its way to this point.

A piece of 2-inch wrought iron pipe, capped, is screwed into the cast-iron radiator pipe under each seat to give additional heating surface. The object is to condense as much of the steam in the radiators as possible, and this is done by throttling the exit from the cast-iron pipe. The two exits are connected with the reversing valve by two pipes which go through the floor and are brought by the reversing valve again into one pipe. The arrangement from this point is the same as in the supply pipe—namely, the pipe leaving the reversing valve connects with a three-way cock R, situated on the main return pipe S', which runs the entire length of the car, and on the ends of which the couplings are placed, forming again when coupled a main return pipe running the length of the train; the object of the three-way cock here is the same as in the former case, and is operated from the inside of the car.

This return pipe connects with the suction end of the pump so that all of the condensed water is drawn out of the system into the return pipe, which conducts it to a condensing coil in the tank, to insure all of the steam being condensed before entering the pump; after passing through the pump it is discharged into the tank. The connection T, from the pump, leads to the tank.

Reference was made to a reversing valve. The conclusion that will have been drawn from the foregoing is that there are two main pipes under each car, one a supply, the other a return.

Should a car or a train be reversed, the pipes will change places; that is, instead of having the supply pipe on the left-hand side, it will be on the right-hand side; the object of the reversing valve is to obviate this difficulty, and is so arranged that by a simple movement, from inside the car, the pipe that was performing the duty of a supply will now perform the duty of a return. Another important feature of this valve is that by further movement a connection is made with the exit from the radiator pipes to the atmosphere, thereby changing the system to a direct one; the advantage of this is that in the event of the pump failing it would be the work of a minute to set the valves for the direct steam. Again, should it be necessary to couple one of these cars to a train fitted with the direct system, it would work equally well. The couplings used are what may be termed as "male and female," and so arranged that one of the same kind is on opposite diagonal corners of the same car; the male coupling is attached to the main pipe by means of a rubber hose pipe in the form of an "S" in a horizontal plane, which allows for all of the movements between the cars, while the female is screwed on the main pipe on the opposite side.

The male coupling has placed on it a spiral spring inclosed in a case, movable in a longitudinal direction; upon this case are placed two trunnions; the female coupling has fastened to its end a joint ring for making it tight against the end of the male coupling; upon it are also placed two trunnions which serve as the hinges for the latch. This latter consists of a forked bell-crank fulcrumed upon the trunnions, and has its short arms furnished with recesses arranged to engage with trunnions on the male coupling.

When two cars are brought together, the latches are thrown back and male and female couplings brought end to end; a movement of the latch in opposite directions causes the recesses on the short arms of the latch to engage with the trunnions on the male coupling, the two arms brought tight against each other, and in so doing, the spiral spring is compressed, which allows for small variations in length of the couplings and insures the same pressure between their faces.

The long arm of the latch is fastened by means of a chain to the platform of the car upon which the male coupling is placed, and this chain is made of such length that when the cars are uncoupled, it will pull the latch over and release the steam coupling.

The operation of the system is clearly indicated by the arrows of the diagram.

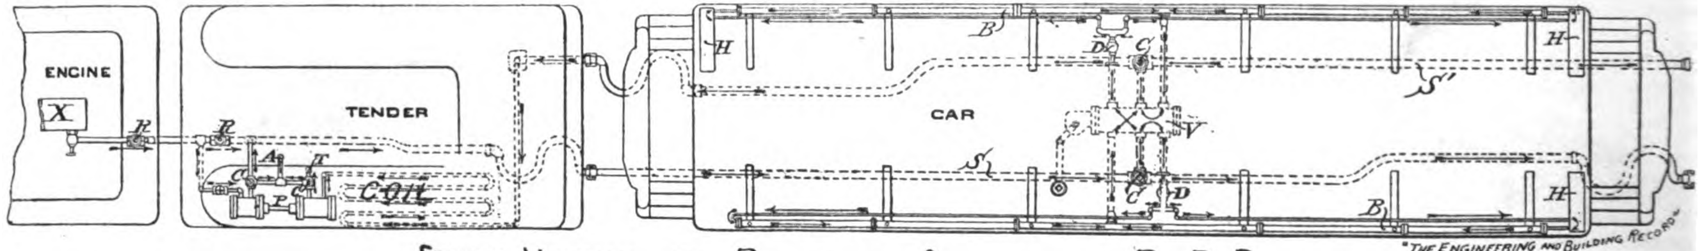
The problem of heating a train on a cold day is a simple one as compared with that of heating a train on a mild day. It will be understood that the direct system requires steam at some pressure for distribution, and so in the pipes there can never be a temperature of less than 212° Fahr.

With such a temperature on a mild day it is difficult to regulate the temperature of the cars. The Pennsylvania Railroad Company have arranged their system so that in mild weather only the exhaust steam from the pump is used; the pump creates a vacuum and this exhaust steam passes through the system in the form of a vapor, making it comparatively an easy matter to maintain the temperature at not more than 1° Fahr. above the atmosphere, if necessary. The pressure in the radiator pipes, etc., inside the cars, varies from zero to one-half pound; this latter pressure is required in the coldest weather only. In case of accident, there would be no danger from escaping steam.

When it is necessary to heat a train quickly, the pump is started, and a pressure of twenty pounds is turned into the train pipe; this will raise the temperature 15° to 20° Fahr. every five minutes.

When the car becomes warmed to the required temperature, the pressure is reduced to the normal working.

Cars when once heated are found to retain their heat for considerable time. Ten minutes before the train arrives at its destination, it is usual to shut off all the steam from the train; the pump is kept going to draw all the water out of the system, so that when the couplings are undone there are seldom more than a few ounces of water to come out.



STEAM HEATING FOR PASSENGER CARS ON THE PA. R. R.

In connection with the heating, much care has been given to secure ventilation, and with the following simple arrangement excellent results have been obtained.

Beneath the cast-iron radiator pipes, are placed a series of air tubes, one under each seat; these make a connection with the outside air through a 2-inch opening. The hot air rising from the radiator pipes naturally draws the fresh air in from these tubes, which becomes heated, and rising up passes out through the deck ventilators inducing a current of warm, fresh air which is made to pass through the car at all times.

In the return system, the steam taken from the boiler does not seem to affect the steaming of the locomotive.

During the winter of 1889-90, seventy cars were put in use and performed satisfactory service.

KEOKUK, IOWA, appears to have experienced a building boom during the year just closing. Eight hundred thousand dollars are said to have been expended in the construction of new buildings, and architects, contractors, builders and artisans have been kept unusually busy to complete the various structures for industrial, mercantile and residence purposes.

ADVICES from Boston state that applications for fuel gas are coming in in large numbers to the Boston Gas Light Company, and the company is busily engaged in putting in services along the lines of the mains it will use for this purpose.

PITTSBURG citizens are at present actively discussing the merits of vulcanite asphaltum pavement, which is being put down in several streets. Considerable dissatisfaction has been expressed with it.

ACCORDING to a San Antonio, Tex., dispatch, the Aransas Harbor Company has succeeded in perfecting financial and other arrangements for deepening the water over the bar at Aransas Pass, Tex.

Questions and Answers.

All questions relating to building construction, paving, sewerage, water supply, or kindred subjects, will be welcomed in this column provided they relate to matters of general interest and are not such as should properly be referred to a consulting engineer. Answers will be carefully prepared and a proof of both question and answer mailed to the inquirer as early as proper consideration will permit. They will be published for the benefit of other readers as soon as convenient. The full name and address should be given, not necessarily for publication, but as a guarantee of good faith, and to facilitate further correspondence in case the question is not sufficiently explicit.

Inquiries of the Editor, in order to secure prompt attention, should *not be written on the same piece of paper as a communication* to the *Publishing Department*. Letters renewing subscriptions are sent to a clerk in the publishing office, and matter for the Editor, if in the same enclosure, is likely to be overlooked unless it is on a separate piece of paper, so that it may be promptly sent to the Editor.

WATER ANALYSTS.

B. D. MCCONNELL, Superintendent of Water-Works Montreal, Can., writes: "The Water Committee of the City Council of Montreal has instructed me to have samples of our city water supply analyzed by the best experts in that line in the United States. Being unacquainted with the standing of gentlemen of the profession in New York, may I ask you whom you consider I should do best to apply to. Chemical and biological examinations of the samples are both required."

[It is obviously inadmissible for us to recommend either special persons or appliances in cases of inquiries of this general class. We would say, however, that in our professional columns will be found the names and addresses of several men who make a specialty of the kind of work in question.]

IT is stated that nickel-in-the slot hot water apparatus is now available in some of the streets of Paris. For 5 centimes about nine quarts of water are delivered. The machines are described as containing gas burners and coils of pipe designed for very rapid heating.

Notes and Queries

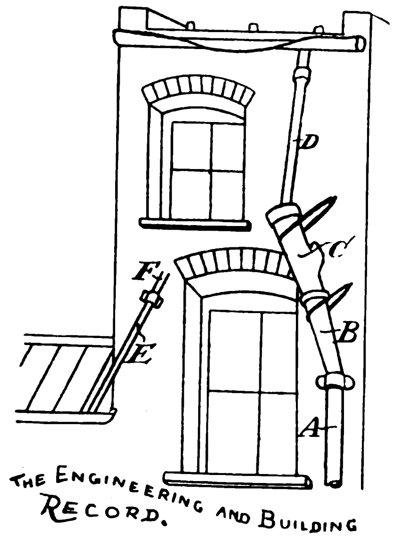
on Domestic Engineering.

Communications relating to the practical details of plumbing, heating, lighting and ventilation will be welcomed in this column. The writer's true name and address must always be given, but an assumed name may be used for publication if preferred.

AN EXAMPLE OF PLUMBING BOTCHING.

J. W. CLARKE, London, Eng., writes: "The following illustration represents a piece of botched plumbing work found in a house in London, the rental of which is about £56 per annum. In the sketch A is a length of common light iron rain-water pipe; B is a 4-inch by three-inch stoneware taper pipe; C is a 4-inch stoneware junction. B and C were suspended by means of pieces of common flat hoop-iron nailed to the wall. The junction pipe was to receive the outlet end of the trap of a new water-closet, fixed inside the building. The pipe D, connected to the top end of the junction pipe, was to convey the rain-water from the eaves gutter to the soil-pipe, and also act as a drain ventilator.

The pipe E is a 2-inch light cast-iron pipe, the bottom end discharging into the eaves gutter of a small conservatory and the upper end receiving a 1-inch lead pipe, F, which is used as a waste pipe from a new bath fixed in the same room as the water-closet. The ground near the conservatory is saturated with the waste water which overflowed the guttering when the bath was emptied.



Anyone would know at a glance that a plumber did not fix the work, but that it was done by one of those pests in all trades, known as "handy men," who can do almost anything (?) and are a disgrace to the craft to which they attach themselves. The strange part of the problem is that there are enough idiots in the world to employ such men, and thus encourage them to persevere in their evil ways without check of any kind. The Plumbers' Registration Council is powerless to act in such matters, and there is no authority to prevent such work being done."

EXHAUST STEAM HEATING.

"PLUMBER," St. Thomas, Ont., writes: "I inclose you sketch of a building to be heated by steam. I want to know if I can heat it with exhaust steam only, and how to arrange pipes; also, if I were to use live steam and exhaust together, and if I used the boiler steam to run an engine, how would I manage to run a low pressure system of heating without interfering with the working of engine? Should I use a steam trap to return condensed water to boiler? I should like, also, a short rule to find the number of feet of 1-inch pipe that it will take to heat any size room. Give me all the information you can to help me in a job of this kind."

[You can use the exhaust steam from an engine to warm a building. This, of course, will be a "low pressure" system, but not a direct return system. It will be a pumped return system.

Set your boiler, then connect and pipe your engine in the ordinary manner, running exhaust pipe to roof. Put back-pressure valve in the exhaust pipe at any suitable position near roof. Take a branch of the exhaust pipe from below the back-pressure valve to a grease separator; thence, from the grease separator to the main pipe of the heating apparatus. Pipe the building as you would for ordinary low-pressure work, but instead of returning to a boiler, return to a receiving tank. From this receiving tank pump condensed water into the boiler with duplex pump and pump governor. This is the ordinary exhaust system of low-pressure heating.

It may be that your engine will not make enough exhaust steam to fill the heating pipes at all times. In that case you must make a live steam connection between boiler and heating pipes, in which there will be a pressure regulating valve. This, if properly arranged, will open and give live steam to the heating pipes should the exhaust steam prove insufficient.

You must see that the arrangement of your pipes is such that no live steam will pass into the heating pipes and be lost to the roof through the exhaust pipe.

In recent back numbers—our issues of March 2 and April 6, 1889, for example—we show arrangements of exhaust piping for heating apparatus that may be studied to advantage.

We have not reproduced the sketch mentioned by our correspondent as it represents simply a vertical section of an ordinary flat roof building with dimensions of rooms marked on it. The amount of heating surface to be provided for each room cannot be determined by any set rule. It will vary with locality, exposure, purpose of the rooms to be heated, etc. One square foot of heating or radiating surface may be allowed for from about 30 to about 70 cubic feet of space to be heated, with exhaust or low pressure steam and direct radiation. The number of square feet of surface in given lengths of pipes of different diameters is given in some of the books devoted to the subject of heating—Baldwin's book on "Hot Water Heating and Fitting," for example.]

STEAM HEATING SURFACE FOR DRYING-ROOMS.

"STEAM GAUGE," Kingston, Ont., writes: "Will you please state what radiating surface at a steam pressure of 100 pounds will be required to heat a drying tunnel 6x7 feet in cross-section by 75 feet long to a temperature of 300 degrees?

Also, what amount of radiating surface will heat an unplastered brick building 76x40x13 feet to a temperature of 160 degrees with steam at 70 pounds pressure?"

[You have omitted a very important item of data in asking the first question. You make no mention of the amount of air that is to be changed in any given time. With the tunnel absolutely closed up and well protected we have no doubt but that a coil of ten one-inch pipes run the whole length will be sufficient. This surface, however, being only about 37 degrees hotter, at 100 pounds pressure of steam, than the temperature at which you wish to keep the air of the tunnel, will not more than make up the heat that is carried off through the brickwork, and when steam is first turned on, if the brickwork is fresh and contains much moisture, it may take a considerable time before it will bring it to this temperature. This does not take into consideration the moisture to be driven off from the materials to be dried. The moisture in the air of a drying kiln plays an important part in the rise of temperature. If the air can be kept absolutely dry or nearly so, it can be warmed considerably above 212° Fahr. When moisture is present, however, evaporation first goes on, and afterwards the moisture held in the air and the air itself may readily advance to a temperature of about 212 degrees (the temperature of the vapor of water at atmospheric pressure). But to warm the vapor beyond this point it requires to be superheated and kept from contact with walls, or elsewhere from which it can draw additional moisture. If this is done the temperature of the drying kiln or tunnel may be advanced by a further application of heat, and we have no doubt that temperatures of 300 may be obtained, if moisture and the passage of air be cut off. High temperatures are best obtained within metal lined chambers backed with some non-conducting surface. Air at 300 degrees can also be obtained by forcing it between steam coils at high temperatures, but not allowing it to come in contact with the moisture afterwards. The specific heat of air is low, and though it is easily warmed on that account, the same reason accounts for its being unable to evaporate moisture to any considerable extent without materially lessening its own temperature. To make a drying-room effective, therefore, large quantities of dry air must be moved through it, and our experience is, that when a temperature of 300 is required to be maintained, and drying by evaporation is required, the only way is to force hot dry air through the tunnel, the air being heated outside. If a baking oven only is required to harden varnishes, then it may be done with direct steam heat, and we are of the opinion that fully 700 square feet of surface will then be required.

In reply to the second question, you give us no data in regard to the window surface or the amount of air to be moved, so that it becomes almost guesswork to reply to this question. According to Baldwin's rule it would require about 360 square feet of surface, at 70 pounds steam, provided there were no windows in the building, and no air move, or no great amount of moisture to evaporate, and that, with ordinary proportioned windows, it would require from two to three times as much surface, say 700 to 1,000 square feet.]

HEATING A SWIMMING BATH.

A. T. ROGERS, of New York, writes: "This problem has been put to me: 'How much coal is required to heat the water in a swimming bath, containing, say 85,000 gallons of water, by hot-water circulation?' The system proposed is to connect the flow pipe from the heater at one end of the tank, near the top, and the return at the bottom at the other end, thus causing all the water of the bath to pass through the heater. From data which I have obtained, I have calculated that to raise this amount of water from, say, 40° to 90° Fahr., would require the consumption of about 2,800 pounds of coal. Allowing a consumption of 5 pounds of coal per hour per square foot of grate surface, a grate containing 56 square feet of surface would be required to do the work in ten hours. I should like to hear from the experience of others in this kind of work.'

[The 85,000 gallons of water would weigh, approximately, 708,333 pounds. To raise the temperature of this weight of water from 40° to 90° Fahr., or through 50° Fahr., would call for the expenditure of about 708,333x 50, or 35,416,650 heat units. Assuming that 10 pounds of water can be evaporated by 1 pound of coal (good ordinary practice), it will require about 3,541 pounds of coal to do the work required in ten hours, or at the rate of 354 pounds of coal burned per hour. Allowing, say, 10 pounds of coal to be burnt per square foot of grate surface per hour, which is a fair figure, 35.4 square feet of grate area would be required to do the work.

TRADE PUBLICATIONS.

STEEL RULES AND TAPES.

THE Lufkin Rule Company, of Cleveland, O., has brought out a new catalogue, dated October, 1890, and containing illustrations, price lists, and descriptive particulars of their different varieties of rules and tapes, among them board and log rules and miscellaneous specialties for lumber men. The pamphlet covers 28 pages, and is neatly arranged.

WATER-WORKS SPECIALTIES.

Catalogue No. 25, recently issued by the Union Water Meter Company of Worcester, Mass., illustrates and describes a number of the water-works specialties made by them. Among the devices shown are a water pressure regulator, several forms of water meter, and apparatus for tapping water pipes under pressure.

STEAM AND WATER SPECIALTIES.

The Curtis Regulator Company, of Boston, Mass., describe their several steam and water specialties in a new pamphlet issued a few weeks ago. Their steam and water pressure regulators, expansion and return traps, damper regulators, combined separator and trap, and other similar appliances, are explained by general and detail illustrations, and tables of sizes and prices are given.

PRIZE ROAD ESSAYS.

A COMMITTEE of citizens of Philadelphia recently offered, through the University of Pennsylvania, prizes amounting to $700, for the best papers on Road Making and Maintenance, embodying the engineering, economic and legislative features of the problem. The contributions received were referred by Dr. William Pepper, Provost of the University, to a Board of Adjudicators, composed of Alexander J. Cassatt, C. E., Chairman; William Sellers, M. E.; Joseph M. Wilson, C. E.; William H. Wahl, Ph. D.; Thomas M. Cleeman, C. E.; Hon. Wayne MacVeagh, and Prof. Lewis M. Haupt, C. E., Secretary. The Board awarded the first prize, of $400, to Henry Irwin, B. S., C. E., Assistant Engineer, Canadian Pacific Railway, Montreal, Canada; the second prize, of $200, to David H. Bergey, B. Sc., M. D., North Wales, Pa.; and the third prize, of $100, to James Bradford Olcott, practitioner and writer upon the subject, South Manchester, Conn.; and honorable mention, without reference to order, to Edwin Satterthwait, President of the Cheltenham and Willow Grove Turnpike Company, Jenkintown, Pa.; Charles Punchard, former Surveyor of Roads in England, Philadelphia, Pa.; George B. Fleece, C. E., Memphis, Tenn.; Frank Cawley, B. S., Instructor in Engineering, Swarthmore, Pa.; and Francis Fuller McKenzie, C. E., Germantown, Pa.

Novelties.

Devices are described under this head purely and strictly as news; because believed to be new and calculated to interest readers.

In no case is pay accepted, directly or indirectly, for publishing a novelty notice.

As the subjects are selected for their supposed novelty and interest merely, it will, of course, be understood that the selection does not imply indorsement.

A SPECIAL HOISTING ENGINE SPOOL.

IN erecting the St. Paul High Bridge* the most of the viaduct members, pieces weighing up to 10 tons each, were hoisted from the ground, many of them nearly 150 feet, and for this purpose three steam hoisting engines were used, each fitted with two drums and four spools, any one of which could be worked independently of all the others. The device is illustrated herewith. Figs. 1, 2, 3 and 4 show the shifting arrangement for throwing the spools in and out of gear.

Figure 1 is a section of the spool, shaft, etc., at G H, Figs. 2, 3 and 4, Fig. 2 is a half elevation at I J, Fig. 1, and Fig. 3 is a half section at A B, Fig. 1. B is the driving shaft which runs constantly and has a winding drum in the middle and a loose cast spool C at each end. O is a cast end plate, and the shaft has a journal fit at M and M. M is a wrought collar fastened by set screws to shaft B.

Fig. 4
A SPECIAL HOISTING ENGINE SPOOL

Figure 4 is an elevation from K L, Fig. 1, of the end of the shaft B, and attached clutch mechanism, with the spool removed. The left-hand portion of the shaft B and the pins R and Q are all actually in cross section, but are shown in elevation for greater prominence. P P, etc., Figs. 1 and 3, are bosses cast on the spool to form the clutch. The driving shaft B has a slot S in which the cross key Q slips freely. When Q is at the right of the slot, in the position shown, it engages the clutch P P and, rigidly connecting the shaft and spool, causes the latter to revolve with the former. If the key Q is pushed to the extreme left of the slot S it is disengaged from the clutch P P and revolves freely in the hollow of the spool without turning it. The key Q is operated by the wooden handle Z and hollow bar T to which it is attached by a pin R and cotter U. It is held in place by the lever V, whose boss W, in the position here shown, engages the end of the shaft B and prevents Q from slipping to the left. The lever Z is always raised by a spring Y; if it be depressed to the position shown by the dotted lines the boss W can enter the end of the shaft B and the key Q may be pushed to the left hand end of the slot S, disengaging the clutch P P and allowing the shaft B to run loose in the spool. As soon then as the lever V is released the spring Y will force the boss W into the chamber X and keep the key Q securely in the new position The teeth F F can be made to engage a large gear wheel on the main shaft that is provided to give special power.

The above details were designed and used by Horace E. Horton, C. E., contractor for the erection of the High Bridge. These spools have been since used elsewhere and are said to give good satisfaction.

MORTAR MIXER.

FIGURE 1 is a plan and Fig. 2 a section at X X of a rocking basin for mixing mortar, slaking lime, sifting sand, etc.

The semi-cylindrical basin A receives the mortar and is rocked by the handle E, the teeth B B meshing in rack B to secure steadiness; C is a cast-iron mixer (shown in detail in Fig. 3), whose half-round bars slope in opposite directions, and which is loosely pivoted on centers P P so as to oscillate whenever basin A is moved; D is a screen confining the contents of the basin, and secured by the bar E fastened to both ends of band F which encircles the basin; G is a wooden block to prevent clogging.

The mixer C is removed when the machine is used to slake lime, and also when it is used as a sand sifter. The block G is then pivoted in its place and the sieve H is added as shown, and the sand passed through it. In Fig. 1 parts of screens D and H are shown removed.

The apparatus was invented by J. H. Poorbaugh, of Burrton, Kansas.

ANNUAL REPORTS.

REPORT ON DISPOSAL OF THE SEWAGE OF THE CITY OF TORONTO. By W. T. Jennings, City Engineer, August, 1890.

Reports upon the disposal of the sewage of Toronto have already been made by Messrs. Shanly, Brough, McAlpine and Tulley, Sproatt and Hering and Gray. This report of the City Engineer seems to be for the purpose of enabling the city to settle definitely upon some plan from the various ones which have been submitted to it. There seems to have been considerable similarity in these plans, and Mr. Jennings states that, after examining them and considering the subject, the opinion which he submits "is much in keeping with the expressions of my [his] predecessors, especially Messrs. Hering and Gray."

The project contemplates intercepting the sewage (including a small percentage of storm water) of existing and projected sewers, for a greater part of the city, by two main intercepting sewers—one high level and the other low level, and both located for most of their course approximately parallel to the shore of the lake. According to the plan of Messrs. Hering and Gray, there would be a single outlet for both sewers, into deep water in Lake Ontario near the eastern limits of the city, over six and a quarter miles from the intake of the water works, the sewage from the low level being pumped into the high-level sewer. Mr. Jennings, to do away with the pumping station, proposes to discharge the low-level sewer into the lake by gravity, at a separate outlet, to be four and a quarter miles from the water-works intake.

SEVENTEENTH ANNUAL REPORT OF THE BOARD OF WATER COMMISSIONERS OF THE CITY OF YONKERS, N. Y., for the year 1889.

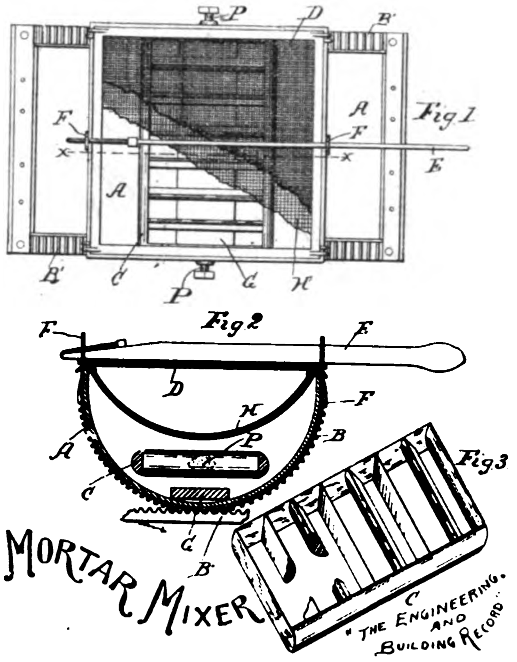
According to the report of the Superintendent, Joseph A. Lockwood, 8,415 feet of 4 inch to 18-inch pipe have been laid during the year, the total length of mains being now 36½ miles. The average cost of pumping for the year per 100 cubic feet was 1.33 cents, and the total cost of 100 cubic feet, including maintenance and interest on bonded debt, 8.06 cents. Per million gallons these items of cost are $17.78 and $107.75, respectively, the total amount pumped in the year being 736,094,975 gallons.

The report of the engineer, William H. Baldwin, is devoted to an account of the construction of additional sewers.

THE MUSCLE SHOALS IMPROVEMENT IN THE TENNESSEE RIVER.

IN our last issue we briefly announced the completion of the Muscle Shoals improvement in the Tennessee River.

The latter, which Major McFarland, of the U. S. Engineer Corps, says is a larger river than the Ohio, averaging broader and deeper, is 808 miles long from Kingsport, at the junction of the North Fork of the Holston with the Holston, to its mouth at Paducah, 50 miles above Cairo. From Kingsport to Knoxville, 150 miles, the river is only navigated by flat boats, etc., and from Knoxville to Chattanooga, some 200 miles, steamboat navigation depends on the stage of water, but from Chattanooga down to Paducah there would be fair navigation if it were not for the Muscle Shoals, 38 miles long, between Brown's Ferry and Florence, which is 255 miles from the Ohio, at Paducah. This obstruction, which has a fall of 134 feet, renders 360 miles of navigation above unavailable for anything but local traffic, and has been effective in retarding the improvement of both the 150 miles of the main river above Knoxville, and some 300 miles of improvable tributaries in the French Broad, the Hiawassee and the Clinch; or, in other words, has tied up a possible navigation of over 1,100 miles in extent in the main river and tributaries.



The improvement of the Muscle Shoals, which is now completed by the building of locks, dams, and 28 miles of canal and aqueduct, is historic. In 1824 John C. Calhoun, the Secretary of the Treasury, called attention to its necessity, and in 1827 the general Government gave the States interested a land grant, by the aid of which a canal was completed in 1838, but the improvement was of insufficient length. Though boats could pass through it, they could only reach it in favorable stages of the waters, and its use was soon abandoned.

From that time until 1871 Government appropriated only about $53,000 for the whole river. But from 1871 until now $3,112,500 has been appropriated, toward a total estimate of $5,056,000, for the improvement of the river below Chattanooga. It will be noticed that this expenditure has been stretched out over nearly 20 years, and the interest account compounded semi-annually at 5 per cent. per annum amounts to $2,145,300, or about two-thirds of the cost. If the deterioration of plant by decay and the loss consequent on the uncertainty of appropriations is added to the interest account, the aggregate of the direct losses from delay will probably amount to fully one-half of the cost of the improvement up to this time. And this has been a dead loss; for, with the exception of one cargo boat that passed through the canal about a year ago, the improvement during the 20 years it has been prosecuted has been of no use to those living on nearly 900 miles of stream above it.

DURING the past year the Manhattan Elevated Railway Company, of New York, carried 188,203,877 passengers. The receipts were over nine and a half million dollars, and the net earnings amounted to $4,246,828.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

THE ENGINEERING AND BUILDING RECORD,
277 Pearl Street, New York.
November 22, 1890.

ARCHITECTURAL COMPETITIONS.

ASYLUM. LOS VEGAS, N. M.—Plans are wanted until January 20, for an insane asylum to be erected in this city. For circular of instruction, address William A. Vincent, President of the Board of Trustees of the New Mexico Insane Asylum, as above.

CONTRACTING INTELLIGENCE

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." *Information of importance sent to us exclusively, and not elsewhere published will be liberally paid for.*

For works for which proposals are requested see also the "Proposal Columns," pages i-ii-403-404

WATER.

For Additional Water Items see Proposal Columns.

YORKSHIRE CENTRE, N. Y.—Town Clerk D. S. Churchill writes: "There has been no steps taken here in regard to the water-works, except a petition for a permit from the Town Board to grant a franchise to a company from Stamford, N. Y., the capital stock of said company to be $18,000. The distance from town to water-supply, one-half to one mile. Elevation, 150 to 200 feet, of easy access."

ALBION, N. Y.—Town Clerk Fred. Butler writes, regarding the water-works question, as follows: "A survey of the village has been made, at a cost of $800, and a report thereof sent to the State Engineer and by him approved and returned to the village authorities and await their action."

TOCONY, PA.—Improvements, to cost $50,000, are to be made to the plant of the Disston Water Company at this place.

CANAAN, N. H.—Reports say that a system of water-works is to be established at this place.

SEATTLE, WASH.—Plans for the proposed water-works system for this city are being prepared by Benezette Williams, and at their completion decisive action will be taken.

SALT LAKE CITY, UTAH.—The Expert Water Commission has submitted a part of its report on the water question to the City Council, but no action will be taken until the final report is handed in.

DALLAS, TEX.—Mayor W. C. Conna and several members of the City Council are visiting nearby cities and inspecting their water-works, with a view of making improvements in the system at this place. Particulars can be obtained by addressing the Mayor, as above.

HUNTINGTON, N. Y.—The plans for a system of water-works at this place, prepared by Engineer Oscar Darling, have been adopted, and it is likely that steps towards the construction will be made at once.

SELLWOOD, ORE.—A company has been organized to establish a system of water-works at this place, the estimated cost of which is $25,000. Richard Leaman is one of the incorporators, and can probably furnish particulars.

CRANFORD, N. J.—Town Clerk N. R. Foster writes: "There is nothing definite regarding water-works as yet—mostly rumor—but there will probably be something done in the spring."

WHITEHALL, MICH.—Recorder George E. Covell writes: "The water-works at this place are to be put in by M. Walker, of Fenton, Mich."

SAN ANTONIO, TEX.—Extensive improvements are to be made to the water-works plant of the Southern Pacific Railroad in the vicinity of this city.

SAN ANGELO, TEX.—The following bids for furnishing material for the San Angelo Water-Works were received by J. L. Millspaugh, President San Angelo Water-Works Company, November 10:

A. W. Morgan Manufacturing Company, Buffalo, N. Y.—Size A, No. 4, base for 4-inch valves, $4; A, No. 6, $4.35; A, No. 160, $4.90; freight paid to San Angelo.

Thomas Ashburner, Kansas City, Mo.—Boiler, 52-inch by 14 feet, with 56 3-inch tubes, full front, and all fittings complete, $825. Eddy standard valves, 4-inch, $9.75; 6-inch, $16.25; 8-inch, $23; 10-inch, $33; 12-inch, $42.75. Hydrants, 2 nozzle, 2½-inch, 4-inch inlet, 3 feet from pavement to inlet, $27; freight paid to San Angelo.

Shickle, Harrison & Howard Iron Company, St. Louis, Mo.—Cast-iron pipe, 4 to 12 inch, $39 per ton; specials, $67 per ton; freight paid to San Angelo.

H. M. Sciple & Co., Philadelphia, Pa.—One 11x12 inch Idel automatic engine, $1,105; one boiler, 52-inch by 14 feet, 56 3-inch tubes, half front, no stack, $665; one duplex compound pump, 12-inch by 18 feet steam, 10-inch water, 18-inch stroke, $1,633; one geared power pump, 12x12 inch, $1,830; on board cars in New York and Philadelphia.

George F. Blake Manufacturing Company, New York.—12"x18"x10¼", 18-inch stroke compound duplex pump; one power pump, 12x12-inch: both pumps delivered to San Angelo, $4,440.

The McNeal Pipe and Foundry Company, Burlington, N. J.—Twelve-inch pipe, $27.25 per ton; 10 inch, $27.50; 8-inch, $27.75; 6-inch, $28; 4 inch, $29; specials, 2¾ cents, delivered to Galveston.

Sioux City Engine Works.—Giddings automatic engine, 60 horse-power, $750; on cars in St. Louis.

Gordon Steam Pump Company, Hamilton, O.—One compound duplex pump, 12"x18"x10¼", 18-inch stroke, $1,660; one duplex power pump, 12x12 inch, $1,375; delivered at San Angelo.

Pond Engineering Company, St. Louis, Mo.—One boiler, 52-inch by 14 feet, 56 3-inch tubes, full front, and fittings complete, $793; one Gaskill compound duplex pump, 12"x18"x10¼", 18-inch stroke, $3,200; one Holley duplex power pump, 10½x12 inch, $1,700; Holley hydrant, $28.61; Holley valves, 4 inch, $9.15; 6-inch, $14.63; 8-inch, $22; 10-inch, $30.31; 12-inch, $39.71; one 12x12 inch Armington & Sims automatic cut-off engine, $1,298; all delivered at San Angelo.

The Addyston Pipe and Steel Company, Cincinnati, O.—Twelve-inch, 10-inch and 8-inch cast-iron pipe, $36.10 per ton; 6-inch and 4-inch, $37.10. Special castings, 3 cents; all delivered to San Angelo.

Clinton Iron Works, Buffalo, N. Y.—Size A, 4-inch valve boxes, $3.95; A, 6 and 8 inch, $4.30; A, 10 and 12 inch, $4.85.

Pierce & Thomas, New York.—11x12-inch Porter automatic, high speed engine, $788; 15x24-inch variable cut-off, $1,275; delivered in New York.

Chattanooga Foundry and Pipe Works, Chattanooga, Tenn.—Cast-iron pipe, $38 per ton; fittings, 3¼ cents; delivered at San Angelo.

Anniston Pipe Works, Anniston, Ala.—Cast-iron pipe, $37.60 per ton; special castings, 3 cents; delivered in San Angelo.

Chapman Valve Manufacturing Company, Indian Orchard, Mass.—Post hydrants, two 2½-inch outlets, no frost case, pavement to bottom 3 feet, $24.18; 4-inch water-gates, $10.04; 6-inch, $15.13; 7 inch, $18.63, 8-inch, $22.52; 10 inch, $34.17; 12-inch, $46.41; 12 inch check valve, $73.76; delivered in San Angelo.

R. D. Wood & Co., Philadelphia, Pa.—Twelve-inch cast-iron pipe, $35 per ton; 10-inch, $35; 8-inch, $35 80; 6-inch, $35.80; 4-inch, $36.70. Special castings, $3\frac{2}{10}$ cents per pound. Eddy valves, 12-inch, $41.50; 10-inch, $31.40; 8-inch, $22.15; 6-inch, $15.25; 4-inch, $9.30. Twelve-inch check valve, $67.90; adjustable valve boxes, $3.45; service boxes, $1.50. Mathews fire hydrant, 4-inch 3-foot double nozzle single valve, $27; double valve, $35 50; all delivered in San Angelo.

Ludlow Valve Manufacturing Company, Troy, N. Y.—Four-inch double gate, brass mounted Ludlow valves, $8.96; 6-inch, $15.25; 7-inch, $19.40; 8-inch, $22.65; 10-inch, $31.80; 12-inch, $41.50. Twelve-inch check valve, $51; valve boxes, 4-inch, $3.50; 6, 7 and 8-inch, $3.30; 10-inch, $2.93; 12-inch, $2.30. Fire hydrants: Ludlow rubber faced slide gate hydrants, stand pipe, 5¾ inches diameter, 3½ feet to pavement, two 2½-inch nozzles, $26; all delivered in San Angelo.

Bourbon Copper and Brass Works, Cincinnati, O.—Fire hydrants, with loose casing, double 2½-inch discharge, 4-inch stand pipe, 3 feet to pavement line, $28 50; without frost case, $21; 12-inch check valve, $65; 12-inch stop valves, $39.50; 10-inch, $28; 8 inch, $21; 7-inch, $16; 6-inch, $12.50; 4-inch, $8; delivered in San Angelo.

The Eddy Valve Company, Waterford, N.Y.—Four-inch Eddy fire hydrants, two 2½-inch nozzles, 3 feet to pavement line, $21.50; extra heavy I. B. B., Class 4, water-works valves, 12-inch, $36; 10-inch, $27; 8-inch, $20.25; 7-inch; $16.65; 6-inch, $13.95; 4-inch, $8.10. Twelve inch check valve, $45; delivered in New York.

Valk & Murdoch Iron Works, Charleston, S. C.—Steel boiler, 60 inches by 16 feet, 48 4-inch tubes, half front and fittings complete, on cars at Charleston, for $850.

Buffalo Steam Pump Company, Buffalo, N. Y.—Compound duplex pump, 12"x18½"x10¼", 18-inch stroke, $2,900; duplex power pump, 10¼x12-inch, $1,400; on board cars in San Angelo.

Keating Implement and Machine Company, Dallas, Tex.—Westinghouse compound non-condensing engine, 10 and 18x10-inch, $1,425; F. O. B., Pittsburg, Pa.

Ball Engine Company, by Em E. Davis, Albuquerque, N. M.—12x12-inch Ball automatic high speed engine, steel boiler, 60 inches by 14 feet, 82 3-inch tubes, full front, all fittings complete, $2,600; delivered in San Angelo.

Casey Boiler Manufacturing Company, Chattanooga, Tenn.—Steel boiler, 54 inches by 14 feet, 46 3½-inch tubes, half arch front, all fittings complete, $721; delivered in San Angelo.

The Ellicott Machine Company, Baltimore, Md.—Sixty horse-power tubular boiler, half arch front, $610; 62 horse-power automatic cut-off engine, $645; delivered in Erie, Pa.

Joseph B. Miller, Wilkesbarre, Pa.—Tubular boiler, 54 inches by 15 feet; 64 3 inch tubes, $575; at factory.

Haxton Steam Heater Company, Dallas, Tex.—Horizontal tubular boiler, 54 inches by 14 feet, 53 3½-inch tubes, full front, all fittings complete, $940; delivered in San Angelo.

The Warfield Manufacturing Company, Baltimore, Md.—Sixty horse-power horizontal tubular boiler, full front, complete, $745; at factory.

F. A. Estep, Chattanooga, Tenn.—Sixty horse-power steel boiler, half front, $840; delivered at Brownwood, Tex.

W. A. Hoffman Implement Company, Fort Worth, Tex.—Steel boiler, 52 inches by 14 feet; 56 3-inch tubes, half front, complete, $650; at Indianapolis, Ind.

Dean Steam Pump Company, Holyoke, Mass. St. Louis agency.—Compound duplex non-condensing pump, 12"x18'x10¼', 18-inch stroke, $2,400; same pump, 10-inch stroke, $1,700; duplex power pump, million gallon capacity, $3,000; delivered at San Angelo.

S. S. Mayo & Co, Fort Worth, Tex—Cast-iron pipe, 4 to 12 inches, $35.85 per ton; specials, $3.33 per 100 pounds; delivered in San Angelo.

Sioux City Foundry and Machine Works.—10x16 inch automatic engine; steel boiler, 52 inches by 14 feet; 56 3-inch tubes, full front, all complete, $1,649; delivered in San Angelo.

Ripley & Bronson, St. Louis, Mo.—Cast-iron pipe, 4 to 12 inches, $34.38 per ton; specials, $3.25; empire hydrant, $23.65; gate valves, 12-inch, $41; 10-inch, $30.65; 8-inch, $22; 6-inch, $14.65; 4-inch, $8.75. Horizontal tubular steel boiler, 52 inches by 14 feet, 56 3-inch tubes, fittings complete, $828.50; yarn, 8 cents; lead, lowest market price; all delivered in San Angelo.

Dean Steam Pump Company, Holyoke, Mass.—Compound duplex pump, 12"x18"x10¼"; 18-inch stroke, $1,990; duplex power pump, million gallon capacity, $1,600; delivered in San Angelo.

Beaumont Valve and Hydrant Works, Kankakee, Ill—Double nozzle fire hydrant, $23.50; delivered in San Angelo.

Contracts were awarded to the following bidders:

Ripley & Bronson, St. Louis, Mo.—Pipe and special fittings, yarn and lead, gate valves and covers.

Pond Engineering Company.—Boiler.

Dean Steam Pump Company.—Pumps.

Beaumont Valve and Hydrant Works.—Fire hydrants.

Sioux City Foundry and Machine Works.—Engine.

BELVIDERE, ILL—George H. Hurlbut, City Clerk at this place, writes: "The city will put in a complete system of water-works. Bids will be opened December 16." For further particulars see our Proposal Columns.

HARRIMAN, TENN.—Postmaster W. C. Shaw writes: "Temporary water-works have been constructed by the East Tennessee Land Company. For information concerning permanent water-works for this city address W. H. Russell, General Manager East Tennessee Land Company, Harriman, Tenn."

LISBON FALLS, ME.—W. H. Newell writes: "A party of gentlemen have petitioned for a charter for the purpose of introducing water into the village of Lisbon Falls. Nothing has been done except to give the required notice that they will ask for private legislation at the coming session of the Legislature."

FRANKLIN, N. H.—Town Clerk H. K. Smith writes: "This town, on November 15, voted to construct a system of water-works, to be placed under the control of a Board of six Water Commissioners, to be appointed by the Selectmen, and to be built under the supervision of said Board. Also voted to authorize Selectmen to borrow $80,000 on credit of town to do the work. The Commissioners are not yet appointed. It is intended to let contracts during the winter and begin work in early spring."

GROVETON, N. H.—According to published reports this place is to have a system of water-works.

UNIONVILLE, CONN.—Reports say that the sum of $20,000 is to be expended on a water-works system for this town.

SOUTH BERWICK, ME.—The people of this place will, it is reported, establish a system of water-works.

TOPEKA, KAN.—The following bids for furnishing 1,700 tons cast-iron pipe for Topeka Water Company, were received by Geo. H. Pierson, Consulting Engineer, November 12: Anniston Pipe Works, Anniston, Ala., $36.25 per ton; Gloucester Iron Works, Gloucester, N. J., $37.71; Chattanooga Foundry and Pipe Works, Chattanooga, Tenn., $35; Addyston Pipe and Steel Co., Cincinnati, $31.45; Dennis Long & Co., Louisville, $30.40; Shickle, Harrison & Howard Iron Co., St. Louis, $32 50; R. D. Wood & Co., Philadelphia, $34; Thomas Ashburner, Kansas City, $31.

ROXBOROUGH, PA.—John B. Reilley, of Lancaster, has obtained the contract to build the 148,000,000-gallon reservoir at this place, his bid being $509,000, according to the items of the specifications.

HALIFAX, N. S.—At a meeting of the Board of Works, held November 17, it was decided to engage an expert engineer to examine the water supply, with a view of making such improvements as may be necessary to improve and increase the supply. E. H. Keating, City Engineer, can furnish details.

SAN FRANCISCO, CAL.—The Rio-del-Llano Water Company has been incorporated, to distribute water in this State. Directors William C. Alberger, George W. Wickes, and others. Capital stock, $1,000,000.

LIMA, O.—Further extensions to the water-works system of this city are contemplated.

BATESVILLE, ARK.—John F. King and others have a franchise to build water-works at this place.

LOWELL, MASS.—The Water Board, of this city, contemplates calling for bids soon, for pumping machinery of about 10,000,000 gallons capacity.

BOISE CITY, IDAHO.—The question of water supply has been deferred by the City Council until the latter part of this month.

PERTH AMBOY, N. J.—The people of this place have voted in favor of a new water system. It is proposed to build an aqueduct from Mill Brook to Perth Amboy, a distance of six miles. The reservoirs and plant of the company which supplies water are, it is said, to be bought. The complete plant will cost about $200,000.

LEICESTER, MASS.—Several hundred feet of 10-inch pipe have been added to the supply main for bringing water from the source of supply in Paxton to this place, and more such pipe will be laid later on, as one source of supply, a circular well 30 feet in diameter and about 15 feet deep has been completed, and there still remains a number of springs to be developed. This work is being carried on under the direction of F. L. Fuller, C. E., of Boston, Mass.

WATER-WORKS.—See our proposal columns for information regarding water-works and water-works furnishings at the following places: Harrison, O.; Ballinger, Tex.; Toronto, Ont.; Belvidere, Ill.

SEWERAGE.

For Additional Sewerage Items see Proposal Columns

WEST OAKLAND, CAL.—Efforts are being made to improve the sewerage system of this place. For particulars, address Dr Huntington, as above.

SEATTLE, WASH.—Engineer Benezette Williams is preparing plans, etc., for a sewerage system for the whole city. For particulars, address Mr. Benezette Williams, as above.

ALBUQUERQUE, N. MEX.—The following bids for the construction of sewers were received by Henry Lockhart, Recorder, November 1:

BIDDERS.	23,670 feet 8-inch pipe.	3,829 feet 9-inch pipe.	4,512 feet 10-inch pipe.	2,562 feet 12-inch pipe.	540 feet 18-inch pipe.	3,120 feet 21-inch pipe.	2,900 feet 24-inch pipe.	90 manholes.	30 lampholes.	9 flush tanks.	
Rose & Riley, Albuquerque, N. Mex...	$14,202.00	$2,603.72	$3,654.74	$2,382.66	$880 20	$6,177.64	$6,470.00	$2,904.00	$175.00	$450.00	$40,099.90

SIOUX CITY, IOWA.—The Sioux City Gas Light Company is about to build a private sewer from the gas works to the river.

BRISTOL, CONN.—Engineer T. H. McKenzie, of the Southington Water Co., is preparing plans, etc., for a system of sewerage for this place.

MINNEAPOLIS, MINN.—The Council Committee on Sewers has awarded a contract to Berg & Co. for 250,000 sewer brick, at $8.40 per 1,000. The committee had advertised for bids on 2,000,000 brick, but the other bids were rejected. Bids will be advertised for on 1,000,000 more of brick, which the sewer department will soon need.

BELFAST, ME.—City Clerk L. H. Mursch writes: "A plan for a complete sewerage system for this city has been made by Wheeler & Parks, of Boston, and they estimate that the entire cost of the system will be from $45,000 to $50,000. The city has just completed a small part of the proposed system, having laid an 8-inch tile pipe through a part of main street, at a cost of some $2,500, the work being done by the city direct and not by contract. Probably some $3,000 or more will be expended in building sewers during the year 1891."

MERIDEN, CONN.—It is probable that steps will soon be taken towards establishing a system of sewerage for this city. Particulars can be obtained by addressing Mayor Page, as above.

CANTON, O.—Our correspondent writes: "This city will build a sewage disposal works on the city's sewage farm, in the near future. Plans by Samuel M. Gray, of Providence, R. I., are in the hands of R. R. Marble, City Civil Engineer.

SPOKANE FALLS, WASH.—The plans for a new system of sewerage for this city have been completed by City Engineer Oscar Huber, who can furnish particulars regarding the undertaking.

SEWERS.—See our Proposal Columns for information regarding sewer construction at the following places: Poughkeepsie, N. Y.; Denver, Col.; Mount Vernon, O.

BRIDGES AND IRON STRUCTURES.

For Additional Bridge Items see Propoals Columns.

ELLINGTON, CONN.—A new bridge is to be erected at Sadd's Mill by the New York and New England Railroad Company.

DES MOINES, IOWA—The plans for the proposed bridge at Walnut Street, this city, which are being prepared by City Engineer Schreiner, are almost completed, and it is expected that proposals will be wanted in a few days.

TOPEKA, KAN.—It is now said that it has been decided to expend the sum of $65,000 on the proposed suspension bridge over the Kansas River, at this place.

HASTINGS, MINN. — Measurements are being taken for the proposed railroad bridge over the Mississippi River, at this place, the cost of which is estimated at $175,000. A. J. Hart, of Minneapolis, Minn., can furnish particulars.

ROTHVILLE, MO.—The following bids for the erection of a bridge over Yellow Creek were received by John A. Lee, Clerk Chariton County Court, November 5: Kansas City Bridge and Iron Company, Kansas City, Mo., $1,390; Heidenreich Company, Chicago, Ill., $2,166, St. Louis Bridge and Iron Company, St. Louis, Mo., $1,625; Wrought Iron Bridge Company, Canton, O., $1,475; Lane Bridge and Iron Works, Chicago, Ill., $1,391; Youngstown, Bridge Company, Youngstown, O., $1,630.

WEST BAY CITY, MICH.—The Board of Public Works has decided that the proposed viaduct over the Michigan Central tracks, at Washington Street, is a necessity, and it is thought, therefore, that one will be ordered.

PITTSBURG, PA.—The movement to establish the projected South Side bridge appears to be gaining favor, and recent reports indicate that a conclusion may be arrived at in the near future. Particulars can be obtained by addressing Mayor Gourley, as above.

ALTON, ILL.—Reports say that General Manager Fisher, of the Bluff line, has stated that the Chicago, Burlington and Quincy officials had assured him that both the Alton bridge and the one across the Missouri River would be built.

PHILADELPHIA, PA.—The following bids for constructing wrought-iron western approach to Walnut Street Bridge were received by Louis Wagner, Director of the Department of Public Works, November 17: Levering & Garrigues, Philadelphia, Pa., $203,400; A. & P. Roberts & Co., Philadelphia, Pa., $203,402; Pottsville Bridge Company, Philadelphia, Pa., $199,725.

DETROIT, MICH. — Our correspondent writes: "The tracks of four railroads cross Woodward Avenue, within the city limits, at a point called the 'Woodward Avenue Crossing.' The companies are the Michigan Central, the Grand Trunk, the Detroit Grand Haven and Milwaukee, and the Lake Shore and Michigan Southern. The present crossing is on the surface, but the increased traffic of the road, and the rapid growth of that portion of the city renders a change necessary. The railroads are now considering which is the more desirable scheme—to elevate these tracks about nine feet or to lower them to same extent."

ALBANY, GA.—Reports say that an iron bridge is to be erected over Kinchafoonee Creek, near this place, by the Central of Georgia.

ZANESVILLE, O.—The following proposals for the construction of the overhead bridge across the Muskingum River, at Fifth Street, this city, to replace the present structure, have been opened by the County Commissioners: Variety Iron Works, Cleveland, O., superstructure, iron piling and substructure, $59,499; Edge Moor Bridge Works, Wilmington, Del., Plan A, superstructure, $58,354; Plan B, superstructure, $60,189; earth excavation, 50 cents; under water, $1; timber foundation, coffer dam, etc., $23; piles used in foundation, etc., 40 cents per lineal foot; iron, etc., 4 cents per pound; brick pavement, $2.50 per square yard. Milwaukee Bridge and Iron Works, Milwaukee, Wis., superstructure, Plan 1, $77,077; Plan 2, $72,007; Plan 3, $79,000; Plan 4, $75,677. Pittsburg Bridge Co., Pittsburg, Pa., superstructure, $74,980. Champion Bridge Co., Wilmington, O., superstructure, $79,868. Wrought Iron Bridge Co., Canton, O., superstructure, Plan A, $65,950; Plan B, $67,200; Plan C, $54,000; Plan D, $71,600; Plan E, $72,850; Plan F, $59,650. Mt. Vernon Bridge Co., Mt. Vernon, O., superstructure as per accompanying plan, $81,000. Wisconsin Bridge and Iron Co., Wauwatoso, Wis., superstructure, Plan A, $69,000; Plan B, $8 ,300; Plan C, $81,000. King Iron Bridge and Manufacturing Co., Cleveland, O., superstructure as per accompanying plan, $86,500. Smith Bridge Co., Toledo, O., superstructure, Plan A, $132,0 0; Plan B, $100,000; Plan C, $89,000; Plan D, $70,000; Plan E, $65,000. Penn. Bridge Co., Beaver Falls, Pa., superstructure, bridge and viaduct approaches complete, $79,416. Massillon Bridge Co., Massillon, O., superstructure, Plan A, $73,383; Plan B, $63,125.75; Plan C, $71,132; Plan B, light, $66,725.75; Plan C, light, $74,732. Youngstown Bridge Co., Youngstown, O., superstructure, $73,590; if steel is purchased, $75,510, if reamed. Berlin Iron Bridge Co., East Berlin, Conn., superstructure, $91,980. Chicago Bridge and Iron Co., Chicago, Ill., superstructure $66,559, Groton Bridge and Manufacturing Co., Groton, N. Y., superstructure, Plan A, $57,293; Plan B, $55,293. Columbus Bridge Co., Columbus, O., superstructure, Plan A, $80,260.69; Plan B, $73,649.17; Plan C, $72,464.51; Plan D, $70,639.69; Plan E, $70,165.59; Plan F, $69,785.59; Plan G, $68,285.49; Plan H, $67,694.21.

Substructure: Smith Bridge Co., $8 per cubic yard for masonry, $25 per b. m., for timber. J. B. Townsend, first item, $6.75; second item, $25. Jolly Brothers, first item, $8.25; second item, $28. J. C. McDonnald, first item, $6.80; second item, $25. Milwaukee Bridge Co., first item, $7.95; second item, $24.50. Pittsburg Bridge Co., first item, $9; second item, $30. Edgemoor Bridge Co., first item, $8 75; second item, $23.

CHARLOTTSTOWN, P. E. I.—Mr. Palmer, C. E., has been retained by the Local Government to examine the site of the proposed bridge across the Hillsborough River. He has been furnished with measurements and soundings; and it is said that the Government will obtain from him an estimate of cost, etc. It is reported that the action of the Government in respect to this matter, will be commended by the people of the Province.

JOLIET, ILL.—Fourteen bids were received for the construction of the Third Ward bridge, the figures ranging from $5,000, bid by the Groton Bridge and Manufacturing Co., of Groton, N. Y., to $8,200 bid by the George E. King Bridge Co., of Des Moines, Iowa. The proposals have been referred to the Committee on Bridges, of which Mayor Kelly is a member.

EASTON, MD.—A bridge is projected across the Tuckahoe River at this place, by the Talbot County Commissioners.

BIRMINGHAM, ALA.—It is stated that the North Birmingham Railroad Company proposes to erect a $20,000 bridge on Twenty-sixth Street, this city.

BRIDGES.—See our Proposal Columns for information regarding bridge construction at the following places: Sheboygan, Wis.; Hamilton County, O.

NEW DEPOTS.

PUYALLUP, WASH.—The Northern Pacific Railroad Company has decided to erect a new depot at this place.

TRENTON, N. J.—It is said the Pennsylvania Railroad Company has plans for a new depot at this place.

STREET-WORK AND PAVING.

CAIRO, ILL. — Considerable paving and other street improvements will be done in this city.

CANTON, O.—Considerable street work has been authorized at this place. Address Alderman Dumoulin, as above, for particulars.

MERIDEN, CONN.—Numerous of the public streets of this place are to be repaved and otherwise improved. Mayor Page can furnish particulars.

GENEVA, N. Y.—It is proposed to bond this place for the purpose of making a general improvement of all the public streets.

WESTCHESTER, N. Y.—The citizens of this place have voted the sum of $155,000 for the purpose of improving the streets and highways.

GAS AND ELECTRIC LIGHTING.

ALEDO, ILL.—The taxpayers of this place have decided in favor of electric lights, and a plant is to be established at once. The Electric Light Committee can furnish particulars.

HARRISBURG, PA.—The Oakland Square Electric Light Company has been incorporated, at this place, with a capital stock of $10,000. Incorporators, E. C. Godfrey, T. H. McGowan, and others.

PORTLAND, MICH.—The Town Council of this place has decided to establish an electric lighting plant.

BOISE CITY, IDAHO.—Reports say that the plant of the Capital Electric Light, Motor and Gas Company, at this place, is to be improved throughout.

INDIANA, PA.—It is probable that immediate steps will be taken in the matter of electric lighting for this place. The estimated outlay is $20,000, Edward Rowe can furnish particulars.

GREENVILLE, ILL.—C. D. Holles, W. V. Weise and Vallie Harrold, organized the Greenville Electric Light and Power Company, with a capital stock of $10,000. They will put in a system of public and private lights for this city.

BURLINGTON, VT.—The local electric light company is to make important improvements to its plant.

MONTICELLO, ILL.—A stock company has organized at this place to establish an electric light plant at a cost of $25,000. The Town Clerk can furnish particulars.

KNOXVILLE, TENN.—The Knoxville Electric Light and Power Company has been incorporated at this place.

PHILADELPHIA, PA.—At a meeting of the City Councils' Electric Light Committee, held November 19, permission was granted to the Western Union Telegraph Company, the Diamond Electric Light Company, the Kensington Electric Light and Power Company, and the Manufacturers' Electric Company, to make certain extensions and improvements to their plants in this city. The ordinance authorizing the United Electric Light and Power Company to open streets and lay and maintain underground conduits and wires was referred to a sub-committee consisting of Messrs. Heins, Patton, and others.

CINCINNATI, O.—At a meeting of the City Council, held November 14, the Ball Electric Co. filed a petition for permission to lay underground wires in suitable conduits through the streets, alleys and public places of the city for supplying and maintaining electric lights. The petition was signed by N. G. Kenan, President of the company. It was referred to the Committee of the Whole, and the company notified to submit its plans and such data as it has for information of the Board. Engineer Stewart can furnish particulars.

DAVENPORT, IOWA.—The following proposals for public lighting were opened November 12, by the Light Committee of the Common Council: People's Light and Fuel Co., any number of arc lights above 130, at $98 per annum. Davenport Gas Light Co., 123 arc lamps; 40 on towers, 61 on mast-arms and 22 on poles, $95 per annum for pole lights and $125 for tower lights. The Electric Illuminating Co., of Chicago, put in a complex bid, ranging from $72 to $95 per lamp for arc lamps and from $15 to $18 per year for incandescent lamps. The Thomson-Houston Co., $100 per lamp for arc lights for three years, $90 for five, and $80 for seven; $20 added if lights are placed on towers, according to the plan submitted, or $22, $21 and $20 per lamp for same time on 900 incandescent lamps. The Hawkeye Electric Manufacturing Company submitted a bid varying from the others in form. The proposition is to erect a plant for the furnishing of light in this city, to erect 33 arc lamps on masts or poles, and 500 incandescent lamps to be placed on the hill districts, and for the operation of this plant for the term of seven years to receive the sum of $1,500 monthly rental, at the end of that time the city to become the possessor of the plant without other expense than the formal payment of $1. The proposition carries with it a condition for exemption from taxation for the time proposed.

At a meeting of the City Council, held November 14, the Committee on Lighting reported in favor of granting the contract for city lighting to Electric Illuminating Company of Chicago. An ordinance entitled "An Ordinance authorizing the Thomson-Houston Electric Light Company to erect poles and wires, and to maintain and operate an electric light plant or system in the city of Davenport," was introduced for second reading, and was laid over until the question of city lighting was disposed of. Mayor C. A. Ficke can furnish particulars.

TOLEDO, O.—Efforts are being made in this city to raise $100,000 for the purpose of continuing work on the natural gas pipe line during the winter months. Mr. Jones, of the Board of Natural Gas Trustees, can furnish particulars.

BATESVILLE, ARK.—John F. King and associates have a franchise to erect an electric light plant to be run by the boilers from the proposed new water-works.

MONROEVILLE, O.—The taxpayers of this place have decided to issue bonds in the sum of $20,000, for the purpose of establishing an electric lighting plant.

BRADFORD, PA.—Important improvements are about to be made to the plant of the Bradford Electric Company.

AUBURN, ME.—Important extensions are to be made to the plant of the Lewiston and Auburn Electric Light Company.

BARBERTON, O—An electric light plant is to be established at this place,

MEMPHIS, TENN.—It is proposed to make an increased appropriation for public lighting in this city to enable certain improvements to the plant.

PARKER, PA.—An electric light plant is to established at this place. Address the Town Clerk for details.

ELECTRIC RAILWAYS.—New electric railways are projected, and improvements are to be made to those already established at the following places: Englewood, N. J.; Rockland, Me.; Camden, Me.; Biddeford, Me.; Saco; Me.; Ruston, Iowa; Albuquerque, N. M.; Opelika, Ala.; Providence, R. I., Newton, Mass.; Lowell, Mass.; Beaver Falls, Pa.

BIDS OPENED.

PHILADELPHIA, PA.—Mayor Fitler has awarded to William Steele & Son the contract for the erection and completion of the new buildings for the insane at Blockley Almshouse, at $175,685 for the buildings, $525 for the gas mains, and $3,283 for the kitchen fixtures.

BROOKLYN, N. Y.—City Works Commissioner Adams has opened the new bids for the erection of the Fifteenth and Twenty-second Precinct Police Stations. The former bids were rejected, it is said, because the lowest bidders were not satisfactory to the Commissioner. These are the new figures: Fifteenth Precinct, J. T. Hanlon, $41,380; John E. Williams, $42,600; John J. Cody, $44,200; F. Jezick, $45,750. Twenty second Precinct, John T. Hanlon, $36,050; William J. Moran, $37,485; John J. Cody, $41,500; Peter Clerry, $37,681.

PROPOSALS.

(Continued from page ii.)

ELECTRIC LIGHTING.—Proposals are wanted until December 19, 1890, for lighting, by electricity and gas, the public streets, etc., of FRANKFORT, INDIANA, for a period of five years. Address S. A. COOK, City Clerk.

PROPOSALS FOR BREAKWATER.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 17, 1890, and then opened, for constructing 240 linear feet of **BREAKWATER** at MARQUETTE, MICHIGAN. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 1

PROPOSALS FOR PIER WORK, DREDGING, etc.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 29, 1890, and then opened, for extending and remodeling shore ends and repairs to outer ends of canal **PIERS**, and **DREDGING** at GRAND MARAIS, MICHIGAN. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol 23, page 332, and Vol. 24, page 414, Statutes at Large. The United States reserves the right to reject any and all bids All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 3

PROPOSALS FOR PIER WORK AND Dredging.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 22, 1890, and then opened, for building **SUPERSTRUCTURE** and for **DREDGING** at ONTONAGON, MICHIGAN. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress, approved February 26, 1885, and ebruary 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 2

PROPOSALS FOR DREDGING AND PIER WORK.—U. S. Engineer Office, Duluth, Minn—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 6, 1890, and then opened, for **DREDGING**, and for repairs to breakwater at GRAND MARAIS, MINN. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 26

PROPOSALS FOR DREDGING.—U. S. Engineer Office, Duluth, Minn.—Sealed proposals, in triplicate, will be received at this office until 2 o'clock P. M., December 6, 1890, and then opened, for **DREDGING** in the harbor of DULUTH, MINN., on west side of Rice's Point. Preference will be given to articles of domestic production or manufacture, conditions of quality and price being equal. The attention of bidders is invited to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. The United States reserves the right to reject any and all bids. All information may be obtained at this office. JAMES B. QUINN, Major, Corps of Engineers. 26

PROPOSALS FOR DREDGING.—U. S. Engineer Office, Cleveland, Ohio, November 10, 1890.—Sealed proposals, in duplicate, will be received at this office until 12 o'clock M., on TUESDAY, the 2d day of December 1890, when they will be opened in the presence of bidders, for **EXCAVATING** 925,000 cubic yards, more or less, of material from Maumee River and from Maumee Bay along line of proposed straight channel for TOLEDO HARBOR, OHIO. Preference will be given to materials and plant of domestic production or manufacture, conditions of quality and price (import duties included) being equal. The attention of bidders is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. All information can be obtained at this office. The United States reserves the right to reject any or all proposals. L. COOPER OVERMAN, Major of Engineers. 26

NOVEMBER 15, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M. on the 10th day of December, 1890, for all the labor and material required for the **APPROACHES** to the U. S. Court House, Post-Office and Custom-House at VICKSBURG, MISS., in accordance with the drawing and specification, copies of which may be had on application at this office or the office of the Superintendent at Vicksburg, Miss. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, all bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked "Proposal for the Approaches to the U. S. Court-House, Post-Office, and Custom-House at Vicksburg, Miss." and addressed to JAS. H. WINDRIM, Supervising Architect. 26

PROPOSALS.

PROPOSALS FOR EXTENSION OF PIERS and Repairs.—U. S. Engineer Office, Cleveland, O., November 15, 1890.—Sealed proposals, in duplicate, will be received at this office until 12 o'clock M., on SATURDAY, the 6th day of December next, at which time they will be opened in presence of bidders, for extending pier and making general repair to **PIERS** at the following harbors on LAKE ERIE: Ashtabula Harbor, O.; Fairport Harbor, O.; Black River Harbor, O.; Huron Harbor, O. Preference will be given to materials and plant of domestic production or manufacture, conditions of quality and price (import duties included) being equal. The attention of bidders is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. All information can be obtained at this office. The United States reserves the right to reject any or all proposals. L. COOPER OVERMAN, Major of Engineers. 26

OFFICE CONSTRUCTING QUARTERMASTER, Fort Thomas, Ky., October 27, 1890.—Sealed proposals, in triplicate, subject to usual conditions, will be received at office of Constructing Quartermaster, U. S. A., FORT THOMAS, KY., until 11 A. M., November 27, 1890, and then opened, for construction there, of a **HOSPITAL** and hospital steward's quarters, and for the steam heating apparatus for the hospital, and for the plumbing of each building. The United States reserves the right to reject any or all bids, or parts thereof. Plans and specifications to be seen at this office, with full instructions as to bidding. Envelopes containing proposals should be marked, "Proposals for Hospitals, etc.," and addressed to 1st Lieutenant R. B. TURNER, 6th Inf'try, A. A. Q. M., U.S.A.

PROPOSAS FOR PILES, STONE, ROPE, Wire, Nails, Spikes and Screw Bolts.—United States Engineer Office, Custom House, St. Louis, Mo., November 20, 1890.—Sealed proposals, in triplicate, will be received at this office until 12 o'clock M. on SATURDAY, December 20, 1890, for furnishing and delivering the following articles for use in improving the Mississippi River below ST. LOUIS, MO.: Piles, Stone, Manilla and Sisal Rope, Wire, Nails, Spikes and Screw Bolts. Preference will be given to articles of domestic production or manufacture, conditions of quality and price (import duties included) being equal. Specifications and blank forms for proposals will be furnished bidders on application. A. M. MILLER, Major, Corps of Engineers.

PROPOSALS FOR CONSTRUCTION OF Breakwater at Rockland, Maine—United States Engineer Office, Portland, Maine, November 11, 1890.—Sealed proposals, in triplicate, for construction of **BREAKWATER** at ROCKLAND, MAINE, will be received at this office, No. 537 Congress Street, until 3 P. M. of TUESDAY, December 2, 1890, and then opened. Attention is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. All necessary information furnished by JARED A. SMITH, Lieut.-Col., Corps of Engineers, U. S. Army. 26

U. S. ENGINEER OFFICE, CHARLESTON-Kanawha, W. Va., November 3, 1890.—Proposals for building the **FOUNDATIONS**, and the pier, abutment, etc., for a movable dam at lock No. 8 of the great KANAWHA RIVER improvement, will be received at this office until 3 P. M. of December 19, 1890, and then opened. The attention of bidders is called to the Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. Information can be obtained by application to ADDISON M. SCOTT, Resident Engineer. WM. P. CRAIGHILL, Colonel of Engineers, U. S. A. 1

NOVEMBER 17, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 9th day of December, 1890, for all the **LABOR AND MATERIAL**, and fixing in place, complete, the low-pressure, return-circulation, steam heating and ventilating apparatus for the U. S. Court-House, Post-Office, etc., building at AUGUSTA, GEORGIA, in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Augusta, Georgia. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked, "Proposal for the Low Pressure, Return Circulation, Steam Heating and Ventilating Apparatus for the U. S. Court-House, Post Office, etc., building at Augusta, Georgia," and addressed to JAS. H. WINDRIM, Supervising Architect. 26

NOVEMBER 10, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 29th day of November, 1890, for all the **LABOR AND MATERIALS** and fixing in place, complete, the low-pressure, steam heating and ventilating apparatus for the U. S. Post-Office, etc., building at HOUSTON, TEX., in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Houston, Texas. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, all bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for the Low-Pressure, Steam Heating and Ventilating Apparatus for the U. S. Post-Office, etc., building at Houston, Texas," and addressed to JAS. H. WINDRIM, Supervising Architect. 25

PROPOSALS.

U. S. ENGINEER OFFICE, BURLINGTON, Vt., November 20, 1890.—Sealed proposals, in triplicate, addressed to the undersigned, will be received at this office, until 11:30 o'clock, A. M., December 23, 1890, and then opened, for **DREDGING** 10,000 cubic yards, more or less, from TICONDEROGA RIVER, NEW YORK, and 20,000 cubic yards, more or less, from OTTER CREEK, VERMONT, and depositing the dredged material in deep water of the lake, 2 miles average haul at Ticonderoga River and 4 miles at Otter Creek. Attention is invited to the Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. Detailed information can be had on application to this office. M. B. ADAMS, Major of Engineers. 26-3

PROPOSALS FOR HARBOR IMPROVEments.—United States Engineer Office, No. 366 Milwaukee St., Milwaukee, October 27, 1890.—Sealed proposals, in triplicate, will be received at this office until 12 o'clock, noon, November 25, 1890, and opened immediately thereafter in the presence of bidders for the following harbor improvements: Menominee River, Mich. and Wis., dredging about 200,000 cubic yards; Green Bay Harbor, Wis., dredging about 36,000 cubic yards; Kewaunee Harbor, Wis., pier extension 300 feet, more or less; Manitowoc Harbor, Wis., pier superstructure 600 feet, more or less; Sheboygan Harbor, Wis., pier extension 150 feet, more or less; Harbor of Refuge, Milwaukee Bay, Wis., breakwater extension and superstructure 400 feet, more or less; Racine Harbor, Wis., pier extension 200 feet, more or less; Kenosha Harbor, Wis., pier extension 150 feet, more or less. The attention of bidders is invited to the Acts of Congress, approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. Proposals will be accompanied by a guarantee that if the bid is accepted contract will be entered into within ten days after notice of acceptance. Preference will be given to materials and plant of domestic production and manufacture, conditions of quality and price (import duties included) being equal. For blank proposals and information apply at this office. The United States reserves the right to reject any or all bids. Proposals will be indorsed on the envelope, "Proposals for Menominee River, Mich. and Wis.," or "Proposals for .... Harbor," and addressed to Major CHAS. E. L. B. DAVIS, Corps of Engineers, U. S. Army. 25

NOVEMBER 10, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect of the Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 2d day of December, 1890, for all the **LABOR AND MATERIALS** required to put in place, complete, the iron vault and closet doors for the U. S. Court-House and Post-Office building at PITTSBURG, PA., in accordance with the drawings and specification, copies of which may be had at this office, or the office of the Superintendent at Pittsburg, Pa. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in an envelope, sealed and marked, "Proposal for Vault Doors at Pittsburg, Pa.," and addressed to JAS. H. WINDRIM, Supervising Architect. 25

NOVEMBER 11, 1890.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Supervising Architect, Treasury Department, Washington, D. C., until 2 o'clock P. M., on the 29th day of November, 1890, for all the **LABOR AND MATERIAL**, and fixing in place, complete, the low-pressure, return circulation, steam heating and ventilating apparatus for the U. S. Court-House, Post-Office, etc., building at HUNTSVILLE ALABAMA, in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Custodian at Huntsville, Alabama. Each bid must be accompanied by a certified check for $100. The Department will reject all bids received after the time herein stated for opening the same; also, bids which do not comply strictly with all the requirements of this invitation. Proposals must be inclosed in envelopes, sealed and marked, "Proposal for the Low Pressure, Return Circulation, Steam Heating and Ventilating Apparatus for the U. S. Court-House, Post-Office, etc., building at Huntsville, Ala.," and addressed to JAS. H. WINDRIM, Supervising Architect. 25

ELECTRIC LIGHT PLANT, Washington, D. C.—Proposals are wanted until December 16, for an electric light plant for the New York Navy Yard. Address N. H. Farquhar, Chief of Bureau of Yards and Docks, Navy Department, as above.

STONE, Boston, Mass.—Proposals are wanted until December 15, for the delivery of quarry faced granite ash for the extension of Gallop Island sea wall, Boston Harbor. Address Lieutenant-Colonel S. M. Mansfield, U. S. A., as above.

BRIDGE WORK, Hamilton County, O.—Proposals are wanted until December 13, for the erection of a bridge and repairs to another bridge. Address John Haggerty, Auditor Hamilton County, as above.

ROAD WORK, Atlanta, Ga.—Proposals are wanted until November 27, for the construction of a macadamized road at this place. Address Major J. A. Scully, U. S. A., as above.

SEWERS, Poughkeepsie, N. Y.—Proposals are wanted until November 28, for the construction of certain sewers in this city. Address Charles E Fowler, Superintendent of Water-Works, as above.

WATER-WORKS, Belvidere, Ill.—Proposals are wanted until December 16, for the construction of a complete system of water-works. Address George H. Hurlbut, City Clerk, as above.

SEWERS, Mt. Vernon, O.—Proposals are wanted until December 11, for the construction of certain sewers. Address P. B. Chase, City Clerk, as above.

(Continued on page 404.)

GOVERNMENT WORK.

ST. AUGUSTINE, FLA.—Abstract of proposals for improving St. John's River, Fla., opened November 15, by Captain W. M. Black, Corps of Engineers, U. S. Army:

BIDDERS.	Stone, per ton, of 2,000 pounds.			Oyster shell, per cubic yard.			Mattresses, per square yard, in the work.	Total.
	In the jetty, outside the shore, mean low water line.	In the jetty, inside the shore, mean low water line.	On shore, between mean high and low water lines.	In the jetty, outside the shore, mean low water line.	In the jetty, inside the shore, mean low water line.	On shore, between mean high and low water lines.

WASHINGTON, D. C.—The following proposals for the work specified at the places named were opened on the given dates by the Supervising Architect of the Treasury Department:

El Paso, Tex.—Superstructure and completion of the United States Custom House, Court House and Post-Office, except heating, elevator and approaches. Opened November 12. Bidders: John Myers, San Antonio, Tex., $136,793, Parsons & Richards, Kerville, Tex., stone. Chas. McDonagh, Toledo, O., $167,300, Austin, Tex., Ohio blue sandstone or Buff Bedford. L. L. Leach & Son, Chicago, Ill., $141,969, Ohio blue stone; $148,210, Portage entry. Justin McCarthy, Washington, D. C., $143,217.25, New Mexico sandstone. Anderson Bros., St. Louis, Mo., $143,000, Buff Bedford stone. W. H. Sternberg, Wichita, Tex., $144,290, Pecos red sandstone.

Springfield, O.—Decorative painting, etc., United States Post-Office. Opened November 14. Bidders: Pedrelto & Son, Cincinnati, O., $2,500; Phillipson Decorative Co., Chicago, $2,000; Jas. T. Hall, New York, $5,200; Wildt & Scharsten, Cincinnati, O., $1,875; Wm. Harris, Cambridge, O., $4,500; O. J. Kover & Son, Fort Wayne, Ind., $2,478; Chas. A. Davis & Son, Springfield, O., $3,000; Hudson & Stricby, Washington, D. C., $2,150.

New Bedford, Mass.—Sandstone in lieu of granite for the erection and completion, except heating and approaches, of the United States Custom House and Post-Office. Opened November 14. Bidders: Justin McCarthy, Washington, D. C., $80,830; Sam'l C. Hunt, $87,987; E. Irving Bell $85,850; Darling Bros., $93,742; Gow W. Gay, $87,989.

St. Joseph, Mo.—Tower clock for custom-house and post-office. Opened November 17. Bidders: Joseph Barbarka, Iowa City, Iowa, $675; Seth Thomas Clock Co., New York, $875; E. Howard Watch and Clock Co., Chicago, $750.

Pittsburg, Pa.—Joinery work, wood flooring, etc., for the United States Custom-house and Post-office. Opened November 18. Bidders: Robert Mitchell Furniture Co., Chicago, $165,050; William Russell, Philadelphia, Pa., $169,790; Cochran & Davis, Allegheny, Pa., $411,155; Otto Decker & Co., Baltimore, Md., $159,768; Woods, Jenkins & Co., Cleveland, O., $122,000; Ardell & Blumenthal, Chicago, $196,900.

CHICAGO, ILL.—The following bids for 300,000 cubic yards of dredging in Calumet River, Illinois and Indiana, were received by Captain W. L. Marshall, Corps of Engineers, U. S. A., November 19: Wheeler & Pursell, Portsmouth, O., $36,750; M. A. McGillis & Co., South Chicago, Ill., $45,000; Green's Dredging Company, Chicago, Ill., $42,000.

CHICAGO, ILL.—The following bids for 90,000 cubic yards of dredging in Calumet Harbor, Ill., were received by Captain W. L. Marshall, Corps of Engineers, U. S. A., November 19: W. A. McGillis & Co., S. Chicago, Ill., $12,150; McMahon & Montgomery, Chicago, Ill., $20,700; Green's Dredging Co., Chicago, Ill., $22,500.

CHARLESTON, S. C.—The following bids for furnishing about 110,000 tons of riprap stone on the south jetty, at this place, were received by Capt. F. V. Abbot, U. S. A., November 18: Roderick G. Ross, Jacksonville, Fla., $249,400; Jacob Freday, Pittsburg, Pa., $224,000; Grant & Egan, Charleston, S. C., $267,550.

PROPOSALS.

(Continued from page 403.)

HARBOR WORK, Grand Rapids, Mich.—Proposals are wanted until December 1, for doing certain dredging and general harbor work. Address Major William Ludlow, U. S. A., as above.

CRUISER, Norfolk, Va.—Proposals are wanted until December 2, for furnishing a quantity of materials for Cruiser No. 8. Address Edwin Stewart, Paymaster General, U. S. A., as above.

DREDGING, ETC., San Francisco, Cal.—Proposals are wanted until December 16, for furnishing stone and doing certain dredging at Oakland Harbor. Address Col. G H. Mendeel, U. S. A., as above.

PIER WORK, Cleveland, O.—Proposals are wanted until December 4, for doing certain pier work at numerous harbors on Lake Erie. Address Major L. Cooper Overman, U. S. A., as above.

STREET WORK, New York City.—Proposals are wanted until November 25, for the improvement of certain streets of this city. Address the Department of Public Works, as above.

PAVING, ETC., Des Moines, Iowa.—Proposals are wanted until December 3, for doing certain street work in this city. Address R L. Chase, of the Board of Public Works, as above.

CURBING, ETC., Providence, R. I.—Proposals are wanted until December 3, for doing certain street work in this city. Address John A. Coleman, Commissioner of Public Works, as above.

LEVEES, New Orleans, La.—Proposals are wanted until November 25, for the construction of certain levees. Address Lieut. John Millis, U. S. A., as above.

NAVY DEPARTMENT, Washington, D. C.—Proposals are wanted until December 20, for the construction of one harbor defense ram, one torpedo boat, and one Swift torpedo cruiser for the U. S. Navy. Address B F. Tracy, Secretary of the Navy, as above.

HARBORS, Wilmington, N. C.—Proposals are wanted until December 15, for doing certain harbor work at this place. Address Captain W. H. Bixby, U. S. A., as above.

LIGHTING, Des Moines, Iowa.—Proposals are wanted until November 29, for lighting the public streets, etc., of this city for a term of two years. Address R. L. Chase, of the Board of Public Works, as above.

WANTED.

TOO LATE FOR CLASSIFICATION.

CIVIL ENGINEER, GRADUATE, WITH ALSO some experience during the past summer in surveying, desires a good opening with some engineering firm. Address E. M. S., Box 42, this office.

DRAUGHTSMAN, MECHANICAL, OF MODerate ability, wishes a position with desirable party. One year at Pratt Institute. Reference given if required. Address A. D. WALLING, 618 Macon Street, Brooklyn. 26

WANTED.—POSITION AS SUPERINTENDent of water-works. Address J. G. L., Box 110, this office. 26

SPECIAL OFFERS.

DOUBTLESS many of our subscribers have a friend or friends who think of subscribing to THE ENGINEERING AND BUILDING RECORD for the coming year, and as every paper, however successful it may be, desires to increase the number of its subscribers, the following offers are made, to hold good during October, November and December, 1890:

Any present subscriber can have his subscription extended one year by sending:

One Renewal and One New Subscription..$7.25
" " " Two " " ..10.00
" " " Three " " ..13.00
" " " Four " " ..16.00

The new subscribers will receive, free of charge, the remaining issues of 1890, that is, those which appear after the order is received.

THE ENGINEERING AND BUILDING RECORD,
P. O. Box 3037. 277 Pearl Street, New York.

POLITICS IN THE CHICAGO DRAINAGE COMMISSION.

ABOUT a month ago THE ENGINEERING RECORD published an editorial upon "Politics in Municipal Engineering," prompted by the course pursued by the Board of Trustees of the Sanitary District of Chicago, who are charged with the construction of the proposed drainage canal from the Chicago River to the Desplaines River for disposing of the sewage of the city. There appears now to be need for again alluding to the same subject.

The Chief Engineer of the Board, Mr. Lyman E. Cooley, it seems, has been trying to conduct his department on a purely business basis, selecting men for their merits and not for their politics, or their "pull" with members of the Board. Out of 125 men, only perhaps a dozen (and those in minor positions) owe their appointments to their influence with any of the trustees. This, of late years, has been something quite unusual in Chicago administration, and has apparently excited the hostility of some of the trustees, who wish to conduct the office according to the usual political methods. In June last the Chief Engineer estimated that he could make, in a hundred days, certain surveys for determining which one of four proposed routes should be adopted for the canal. Several sources of delay have occurred, and obstacles have been met with which required the scope of the investigation to be extended, causing, also, somewhat larger expenditures than was expected. As can readily be appreciated by anyone having but a superficial knowledge of such matters, in an important work of this kind the preliminary surveys and researches should not be unduly hurried or the money stinted, as it is all important that they should be thorough, in order that the best location may be obtained and the work most economically executed. Indeed, a liberal policy in this respect is the truest economy. But this delay and increased expenditure have been made the pretext for a renewed attack on the Chief Engineer, stigmatizing the unavoidable failure to complete the surveys at the specified time as an "unfulfilled promise," and he has also been condemned for continuing to make certain investigations actually ordered by the Board, though these could be quickly and promptly stopped if the Board would take the responsibility of rescinding the resolutions ordering them

The Engineering Committee of the Board have recently been holding an investigation, in which they have subjected their Chief Engineer to a long and rigid cross-examination, with the evident purpose of developing something to his discredit, which they could use against him. The animus of this investigation is shown by their demanding that he should answer "Yes" or "No" to all their queries without adding any explanation whatever, the reason given by one of its members being that "the Board did not propose to spend the public money and to waste time in listening to speeches by Mr. Cooley, and that gentleman must, therefore, confine himself to answering such questions as we may see fit to ask."

If the Board of Trustees desire to make a success of their work, and prosecute it with economy, they have got to lay aside "politics" and personal interests. And while they should in no degree give up their personal responsibility or neglect their watchfulness over the work and the expenditures, yet they should lend the engineer their full support and assistance as long as he manifests his competency, honesty and administrative ability, which, up to this time, he has conspicuously done. No engineer of reputation can afford to be held responsible for the success of an engineering work unless he can have the selection of his subordinates and full control over them, and that is the principle for which Mr. Cooley is contending, and he is entitled to the support of all right-minded people.

STREET CLEANING AND DISPOSAL OF REFUSE.

ELSEWHERE in this issue we publish, under the above head, a tabulated statement pertaining to the methods followed in different cities of the United States in cleaning streets and in disposing of the accumulated refuse, and giving figures of cost.

The matter, as explained, originally grew out of a suggestion made a short time ago by Mr. Sylvester H. Martin, Chief of the Bureau of Street Cleaning at Philadelphia, accompanied by a set of returns for that city published at the time. Subsequently returns from several other cities, among them New York, Boston, and Brooklyn, were printed, and it was found expedient to extend the range of inquiry to all the larger cities and towns with the view of determining as accurately as possible the several practices adopted. The main results, with some detail information as to character of the pavements, widths and mileages of streets, etc., are given in the large table. Incomplete though they necessarily are, for reasons pointed out in the article, they are not without importance and value, and furnish a general illustration at least of a subject in which all municipal authorities have a growing interest. The larger and the several smaller tables show, almost at a glance, what line is followed in any of the places from which returns were received, and will, therefore, prove instructive, even on only superficial examination.

NAVIGABLE STREAMS AND SYSTEMS OF IRRIGATION.

AN article appears in *The Gazette*, of Fort Worth, Tex., from a correspondent in Kansas City, stating, upon the authority of a Prof. Richard Meagher, that the diversion of water by the irrigation systems of the far West is having a serious effect upon the navigation of the larger rivers, and predicting that within ten years the Missouri River will be so reduced in volume that even the smallest craft will be unable to ply its waters.

Professor Meagher asserts, what is now generally admitted, that denudation of forests, in the Rocky Mountain region, produces no effect on the amount of annual rainfall. Its only effect is to cause the rainwater to run off much more rapidly into the streams, thus producing heavier freshets, and correspondingly lower stages of the rivers than ever before. But Professor Meagher also claims that these freshets are failing to appear, the storage reservoirs for irrigation purposes retaining so much of the heavier rainfalls as to prevent the freshets from being even as great as they were formerly.

No doubt, extensive irrigation and the building of large storage reservoirs will produce some effect of this kind—but it seems quite unlikely that the comparatively small area yet irrigated, or the moderate size of the storage reservoirs yet built on the Atlantic Slope can have produced any such effect as Professor Meagher states, or that their effect will be as serious in the future as he suggests. Still, the subject may be worthy of more careful investigation.

WAGES RATES IN THE BUILDING TRADES.

The secretaries of the building exchanges in 38 cities in the country have sent to the Wisconsin Bureau of Labor Statistics the schedule of wages in the building trades for each city. Where there is no exchange the information has been supplied by masons and builders. The schedules have been tabulated and interesting facts thus brought to light.

The six cities in which the highest wages are paid are New York, Brooklyn, Chicago, St. Louis, Galveston, and San Francisco. The trades selected for the table were masonry, carpentry, painting, plumbing, roofing, and the common labor required in the erection of a building. No one city pays the highest wages in all the trades, or in more than one trade. Thus, St. Louis pays the highest wages for masonry. New York for carpentry, San Francisco for painting, Chicago for plumbing, Santa Fe for roofing and Galveston for common labor. Santa Fe pays more than any other city for roofing, but it ranks below Brooklyn in all the other trades.

The lowest wages are paid in the Southern cities, Atlanta, New Orleans, Lexington, Va., Vicksburg, and Norfolk, Va. Some of the smaller cities of the North pay but little more than those of the South. Wages in the North seem to depend more on the size of a city than on its location. The explanation is that in the larger cities the trades are better organized. For the same reason two adjoining cities seldom pay exactly the same wages. New York pays more than Brooklyn for painting, carpentry, and plumbing. Brooklyn pays more than New York for masonry, roofing, and for common labor. There is the same difference in the wages paid in the near by cities of Minneapolis and St. Paul, and Cincinnati and Cleveland. Philadelphia and Boston rank below the five leading cities. Atlanta pays the lowest wages for roofing, masonry, and common labor, but comparatively good wages for painting and plumbing.

The difference in the wages rates paid in each trade is as great as their geographical distribution. Atlanta will pay 21 cents an hour for masonry, but St. Louis is willing to give 49 cents for the same work. New York and Baltimore pay 40 cents an hour, and Brooklyn, Galveston, Washington, San Francisco and Chicago from 41 to 45 cents an hour. For carpentry New York pays 39 cents an hour, and Lexington, Va., 18 cents. In eight cities from Minneapolis to Providence, the prevailing rate is 25 cents an hour. New Orleans and Vicksburg are willing to pay 25 and 26 cents, but most of the smaller Western cities will give less than 25 cents for carpentry. For plumbing Chicago pays 40 cents an hour, and Vicksburg 22½ cents. New York and San Francisco pay 39 cents. The other 33 cities follow in no particular order, some of those in the West paying less than Southern cities. The rates for painting show the greatest difference, San Francisco paying 53 cents an hour, and New Orleans 22½ cents. New York pays 52 cents, and Kansas City 51 cents. Indianapolis, Baltimore and Providence are willing to pay 42 cents, and Santa Fé 40 cents an hour. Roofing is paid for at the lowest rate of all the trades, 19 cents in Atlanta. New York pays 34, Brooklyn 37, and Santa Fé 38 cents an hour. For common labor Atlanta pays 7½ cents. New York, according to the table, pays 16 cents an hour less than do Philadelphia, Boston and Brooklyn. Galveston parts with 20 cents an hour, or $2.00 a day, the highest rate of all. The rate in San Francisco is not shown, but from another source it is known that $2 is also paid for common labor there.

Experiments have recently been made at the Cincinnati, O., water-works with the Anderson scrap-iron process of water purification, described some time ago in our columns. The results are reported to have been successful, though it is stated that, through the inadequacy of the small machine used, the full benefit of the process could hardly be determined.

AMERICAN SOCIETY OF CIVIL ENGINEERS NOMINATIONS.

We understand that a committee of five members of the American Society of Civil Engineers have prepared a ticket in which appear the names of those nominated by the Nominating Committee, except those who declined to serve. The Committee's action is in the line of the suggestion in our issue of last week, and in accordance with Section 6, of Article 7, of the Constitution.

Mr. Bogart the present Secretary, we also learn, declines to consent to the use of his name for office of Secretary.

NOTES.

The Executive Committee of the Mississippi River Improvement Association met at Memphis, Tenn., on November 17. A resolution was adopted indorsing the bill introduced into the last Congress appropriating $9,000,000 for the purpose of levee construction in the Mississippi Valley, from Cairo to the head of the passes. A committee was appointed to visit Washington during the coming session of Congress for the purpose of inducing that body to take up the bill at an early date. The members of the association are unanimous in the opinion that the present levee system is the only safeguard against overflow.

The December meeting and monthly dinner of the Architectural League of New York, will be held at Morello's, 4 West 29th Street, New York, on Monday evening, December 1, next, at 6:30 o'clock. It is hoped that the better facilities afforded at the new meeting place will induce a large attendance. A. D. F. Hamlin will read a paper on ' Basilicas and Baths—a Study of the Origins of Byzantine Architecture," which will be illustrated with lantern views.

Philadelphia newspapers complain that many members of the City Council are either directly or indirectly interested in the local electric light companies, and that the latter, therefore, among other things, do not find it difficult to secure all desired privileges for the asking. The peculiar working of the city's political machinery, moreover, is said to effectually prevent all otherwise possible competition on the part of newer companies.

According to Chicago reports, the old project of establishing a direct water route between Chicago and the Atlantic has, in a measure, been revived through the recent researches of Mr. E. L. Corthell, C. E., of Chicago. Mr. Corthell is said to be collecting data and statistics as to the feasibility of canal and ship railway routes that have already been partly surveyed, and shortly expects to incorporate the results of his researches in a report to a party of capitalists which he is said to represent.

Prof. Edward L. Nicholls, of Cornell University, delivered an address on "The Light of the Future" last week before the Electric Club of New York. Professor Nicholls believed that the electric light could not possibly be the light of the future, inasmuch as our descendants will not be satisfied with a light which involves the throwing away of from 90 to 95 per cent. of the potential energy involved in its production. Moreover, the incandescent and arc lights seemed to him to have reached the maximum of their possible development.

Engineers Fteley, Birdsall and McLean, in a joint report to the New York Aqueduct Commission, pronounce the old Croton dam perfectly safe. In view of the magnitude of the interests at stake, however, Mr. Fteley suggests that it would be well to build a dam below to provide against any possibility of accident.

A course of free lectures on roads and road-making will be given at the Case School of Applied Science, at Cleveland, O., beginning on the first Monday in January, 1891, and continuing four weeks.

The carelessness or incompetency of the Brooklyn, N. Y., Building Department, to which we had occasion to refer several times within the past year, has again been illustrated by the breaking down of part of a stand at the Brooklyn Eastern Park, on Thanksgiving Day, during the annual Yale-Princeton foot-ball match. Though the legal responsibility for the accident rests with the managers of the park, the Building Department cannot escape censure, since it issued a permit for the erection of the structure and apparently approved of it without adequate inspection. The speculators who put up the flimsy structure will doubtless have to pay well for their recklessness. But the public have a right to expect an intelligent supervision over the erection of such stands.

MEETINGS OF ENGINEERING SOCIETIES.

The American Society of Civil Engineers holds its regular meetings on the first and third Wednesday in each month, at the House of the Society, 127 East Twenty-third Street, New York.

The Boston Society of Civil Engineers holds its regular meetings at the American House, Boston, at 7.30 P. M., on the third Wednesday in each month.

The Western Society of Engineers holds its regular meetings at No. 78 La Salle Street, Chicago. at 7.30 P. M., on the first Wednesday in each month.

The Engineers' Club of St. Louis holds regular meetings in the club's room, Laclede Building, corner Fourth and Olive Streets, St. Louis, on the first and third Wednesdays in each month.

The Engineers' Club of Philadelphia holds regular meetings at the House of the Club, 1122 Girard Street, Philadelphia.

The Engineers' Society of Western Pennsylvania holds regular meetings on the third Tuesday in each month, at 7.30 P. M., at its rooms in the Penn Building, Pittsburg, Pa.

The Engineers' Club of Cincinnati holds its regular meetings at 8 P. M. on the third Thursday of each month at the Club rooms, No. 24 West Fourth Street, Cincinnati.

The Civil Engineers' Club of Cleveland holds regular meetings on the second Tuesday of each month, at 8 P. M., in the Case Library Building, Cleveland. Semi-monthly meetings are held on the fourth Tuesday of the month.

The Engineers' Club of Kansas City meets in Room 200, Baird Building, Kansas City, Mo., on the second Monday in each month.

The Engineering Association of the Southwest holds regular meetings on the second Thursday evening of each month at 8 o'clock, at the Association headquarters, Nos. 63 and 64 Baxter Court, Nashville, Tenn.

The Civil Engineers' Society of St. Paul meets at St. Paul, Minn., on the first Monday in each month.

The Montana Society of Civil Engineers meets at Helena Mont., at 7.30 P. M., on the third Saturday in each month.

The Civil Engineers' Association of Kansas holds regular meetings on the first Wednesday in each month at Wichita, Kan.

The New England Water Works Association holds quarterly meetings in Boston at Young's Hotel.

The Canadian Society of Civil Engineers holds its regular meetings on each alternate Thursday, commencing with the 9th of October, at the House of the Society, 112 Mansfield Street, Montreal.

The Engineering Department of the Brooklyn Institute, Brooklyn, holds regular meetings, at 8 P. M., on the third Tuesday of each month. Until the Institute building is repaired, the meetings will be held in the rooms of the Young Men's Christian Association Building, 502 Fulton Street.

Chicago is contemplating the building of a tunnel to connect the north and south sides of the city. The tunnel, as now held in view, is to be about one mile long. There is to be a 12 by 14 foot passageway for foot passengers, and a 36 by 18 foot roadway. The cost is estimated at $1,500,000.

PERSONAL.

William Bruce Gray and Aristide Roderigue, architects, of Washington, D. C., have formed a partnership and opened an office in the Willard Iron Building, 1,333 and 1,335 F Street, in that city.

OBITUARY.

Ex-State Senator Edwin H. Hobbs, Civil Engineer of the Amoskeag Corporation, died on November 27, at Manchester, N. H., aged 55 years.

Samuel Barber, the contractor, who, years ago, laid most of the wooden pavement at Elizabeth, N. J., has died at Chicago, at the age of 58. After leaving Elizabeth Mr. Barber went to Washington, where he engaged largely in public works.

Nathaniel C. Scoville, of New York, died suddenly on November 21, in Buffalo. He was at the head of a large car wheel manufacturing company there, and had been in business since 1885 in Buffalo, where he had lived until a few years ago. He was born in Salisbury, Conn., in 1832.

Thomas J. Whitman, died last week at his home in St. Louis, of typhoid pneumonia. He was 57 years of age, and was a mechanical engineer. He was a brother of Walt Whitman, the poet. He was born in Brooklyn, N. Y. His last big work was the building of water-works at Memphis.

J. P. Andrews, contractor, died suddenly on November 27, at his home in Cairo, N. Y., of apoplexy. Mr. Andrews was known in all parts of New York State, having been actively engaged in building railroads and constructing large edifices. One of his most extensive pieces of work was the construction of the Grand Central Station and the Fourth Avenue Tunnel in New York City.

ENGINEERING SOCIETIES.

At a meeting of the Engineers' Club, of St. Louis, held on November 19, Prof. J. B. Johnson read a paper in which he took the position from the standpoint of an engineer that aerial navigation for commercial purposes is now, and always will be, impracticable, and that the air ship will never be anything else than an ornamental machine and a curiosity. His general position was that there was a natural limitation to aerial navigation that could never be overcome, and to reach this conclusion simply required the study and application of well-known fundamental principles familiar to all engineers, without going to the trouble of making experiments. Professor Johnson referred to the experiments made by Raynard, who, in 1885 and 1886, constructed a machine that made five trips and came back to the starting point each time, but who gave up the enterprise after reaching the conclusion that the necessary power could not be obtained. He then presented a formula illustrating the resistance, atmospheric and otherwise, that such a vessel would have to contend with, and demonstrated that it could not be overcome by any methods that could possibly be adopted.

Messrs. Meier, Holman and Potter were appointed a committee to select candidates for offices to be elected at a subsequent meeting. The officers to be elected are president, secretary, treasurer, and vice-president.

ANNUAL REPORTS.

Toronto Water-Works. Annual Report of the Superintendent for 1889.

The water supply of the city is obtained from Lake Ontario at a point 2,357 feet from Hiawatha Island (forming the harbor of Toronto), where it has a depth of 30 feet. A 6-foot wooden pipe connects the inlet crib in the lake with the shore crib; a 4-foot wooden pipe connects the latter crib with a third one at Hanlan's Point on the north side of the island, and a 3-foot cast-iron main is laid from there across the harbor to the pumping station. For the purpose of increasing the water supply of the city an additional pipe (48 inches in diameter, of steel) was contracted for, at date of report, to be laid across the harbor, and a 60-inch steel pipe from Hanlan's Point to the crib on south side of the island. The project of extending the intake, by a 72-inch steel pipe, 350 feet further into the lake to a depth of 60 feet was also under consideration.

The high-level pumping station had formerly a capacity of only 1½ million gallons in 24 hours, but two 3-million-gallon pumping engines of the George F. Blake Manufacturing Company have just been added. The main pumping station has now a daily capacity of 22 million gallons. Mr. William Hamilton, the Superintendent, recommends that the supply should be further improved by replacing a 4-million-gallon pumping engine with one of 8 or 10 million gallons capacity.

The revenue of the water department has increased so much, compared with expenditures, during recent years (yielding each year a handsome surplus), that it has been determined that the consumers ought now to have the benefit of it. An order was therefore issued, and took effect last spring, deducting 60 per cent. from the gross amount of bills for prompt payment. Meter charges also have a discount of 50 per cent. for prompt payment, making the net meter price 12½ cents per 1,000 gallons.

Annual Report of Superintendent of the Montreal Water-Works for 1889.

The Superintendent, B. D. McConnell, urges replacing an old breast wheel which has been in use over 30 years, and is getting into pretty bad order, by a modern turbine wheel; and also urges the insufficiency of the present steam pump at the time of year that the water-power is available. He further calls attention to the fact that one section of a large aqueduct for additional supply was built more than 12 years ago, and that no more work has been done upon it since. Delay increases the cost for land, etc., and if work be recommenced at once the aqueduct will not be completed any sooner than it will be needed. The cost of pumping (pumping house expenses) for the past year was: For low service—By water-power, $1 63 per million gallons raised 169 feet, or 96 cents per million gallons raised 1 foot; by steam power, $13.18 per million gallons raised 169 feet, or 7.8 cents per million gallons raised 1 foot. For high service—By steam-power, $25.78 per million gallons raised 213 feet, or 12.1 cents per million gallons raised 1 foot.

ANCIENT OIL WELLS IN PENNSYLVANIA.

Prof. J. S. Newberry, writing in *Harper's Magazine*, says that petroleum was sought and used in North America perhaps as early as anywhere else in the world, since it was collected in many places and in large quantities by that mysterious people or peoples whom we know as "the Mound Builders."

When in 1859 Professor Newberry went to Titusville, like thousands of others called there by the Drake oil well, he noticed that the bottom lands on Oil Creek below the town, and where covered with a magnificent forest of hemlock trees, were pitted in a peculiar way; that is, the surface was occupied by a series of contiguous depressions 10 or 15 feet in diameter and from 1 to 3 feet in depth. These were circular and symmetrical, in that respect differing from the pits formed by uprooted trees. Inquiring of Brewer & Watson, who had an oil well there, what was the cause of this series of pits, he received no satisfactory answer from them, but a bystander answered his question by taking him to his well, just begun in the vicinity. As it chanced, this well was sunk in one of the pits before referred to. It was carried to the depth of about 25 feet in the earth when rock was reached and the drilling begun. Throughout this depth it followed the course of an old well, which had been cribbed up with timber, and in it was a ladder such as were commonly used in the copper mines of Lake Superior by perhaps the same people who worked the oil wells. This ladder was a portion of a small tree, of which the trunk was thickly set with branches. These were cut off four or five inches from the trunk, and thus formed steps by which the well owner could go down and gather the oil as it accumulated on the surface of the water, just as was done by the old oil producers on the banks of the Caspian and the Irawaddy. Some of the trees which grew over the pits which marked the sites of oil wells were three and even four feet in diameter, thus proving that the wells had been abandoned at least 400 or 500 years ago.

At Enniskillen, Canada, and at Mecca and Grafton, O., Professor Newberry found similar ancient oil wells. At Enniskillen the oil was obtained by sinking pits through 40 or 50 feet of impervious clay. Beneath this the oil accumulated on the surface of the limestone, and sometimes thousands of barrels flowed out when one of these reservoirs was tapped. In sinking one pit, which was 7x14 feet in area, on the banks of Black Creek, the operators found that one corner of their shaft cut into an older shaft, which had been filled up with rubbish, twigs, leaves, etc. At the depth of 27 feet from the surface a pair of deer's antlers were taken from this old pit. Here, as on Oil Creek, the surface was occupied with trees three feet in diameter, and some of them were growing immediately over the old oil well.

NOVEL ENGINEERING WORK.

A novel engineering work has just been completed at the Duddon estuary, on the Cumberland coast, England, and is referred to in London *Engineering*.

For many years past a valuable hematite mine has been worked on the northern shores of this estuary, but at length the ore had been won, close to the margin of the sea, under which the bed of ore extended. To get at some of the ore underneath the sea-bed, a barrier has been constructed, which excludes the sea from an area of 26 acres. This barrier is just two-thirds of a mile in length, and for about one-half this length is fully 50 feet in height from the bottom of the foundations to the top of the parapet. At high water of high spring tides there is a depth of rather more than 20 feet against the seaward face of the work, but being exposed during southwesterly gales to the full force of the waves sweeping up the Irish channel, banked by the Atlantic rollers, the sea at such times breaks with great violence against the new barrier, as was, of course, expected, and has been provided for in the structure just completed. The engineer of the work is Sir John Coode and the contractors are the well-known firm of Messrs. Lucas & Aird. There is every reason to believe that the anticipation of the directors and shareholders of being able to continue the working of the iron ore over a further period of 25 years may be realized, thus giving employment during that time to about 1,500 men.

The Dubuque, Iowa, Street Railway is being fitted up for electric storage battery traction, and will probably be the first line on which the system will be used exclusively.

GREENE AVENUE RELIEF SEWER, BROOKLYN, N. Y.

This sewer, which is one of the largest in the country, is now in process of construction. The Boundary sewer, with a circular section and diameter of 22 feet, and the Tiber Creek sewer, 30 feet in diameter by 11 feet in height, both of Washington, D. C.; the Mill Creek sewer of St. Louis, 20 by 16 feet, and the Mill Creek, 20 feet by 20 feet, but with a larger area than given by a circular section, the Cohocksink, 18 feet 6 inches by 12 feet 8 inches, and the Hart Creek sewers, 16 feet diameter, all of Philadelphia, are believed to be the only larger ones. The St. Louis and Philadelphia sewers and the Tiber Creek sewer of Washington, are all located on the lines of old water courses, which accounts for their large size. The Stony Brook of Boston is also larger, but this is really an elongated culvert, built to obtain an inclosed water-way of capacity sufficient to avoid the disastrous floods which had been experienced before its construction.

The Greene Avenue sewer commences at Marcy Avenue, and runs, *via* Greene Avenue, Fourth Avenue and Butler Street, to the Gowanus Canal. It is intended to take the storm-water from a territory of about 1,500 acres, lying between Marcy Avenue and Flatbush Avenue, and south of Greene Avenue and Hanson Place, and thus relieve the existing sewers which now drain this district into the East River, and which are of insufficient capacity to carry the water of heavy storms from their entire drainage area. It is possible that the sewer may be extended on Greene Avenue for one or two blocks above Marcy Avenue. At Marcy Avenue the sewer, of circular form, has a diameter of 10 feet, which is increased to 12 feet, 14 feet, and 15 feet, as the drainage area increases, continuing 15 feet in size from Raymond Street till its near approach to the street surface, towards the lower end, compels a change of form. For this lower section it is being built with vertical side walls and curved invert, with a flat covering composed of iron beams supporting brick flooring arches. Near the outfall the sewer has a width of 21 feet between side walls, and a central depth of 6 feet.

The sewer will be 12,300 feet in length and have a bottom slope of 1 in 1,000. It is calculated to provide for a rainfall of about one inch per hour, reaching the sewer, when running at its maximum capacity, without any head over the soffit of the arch. At its upper end the sewer is but little below the local sewer, whose overflow it receives, and at its terminus the invert is at the level of mean high tide. Between Marcy Avenue and Dean Street (on Fourth Avenue), a distance of 9,400 feet, the sewer has a depth below street surface, at grade line, varying from 31 to 81 feet, and for this length it is being built by tunneling. From Dean Street to the outlet it will be built in open cut.

The tunnel section of the work is being driven, upon the pilot tunnel system, by Hart, Anderson & Barr, contractors, who also built the Knickerbocker Avenue extension sewer (12 feet in diameter) in Brooklyn in 1885–6, by the same method. The pilot tunnel system was devised, and first made use of, by Mr. Anderson at the Hudson River tunnel in 1880–81, when he was its superintendent.

In this sewer the pilot, composed of wrought-iron plates, with angle iron flanges on all four sides for bolting them together, is about 6 feet in diameter for the 15-foot section of sewer. It is kept some distance in advance of the main tunnel, and is located a little above its axis for convenience in excavating and placing the plates above it. In driving the pilot, the upper plates, which are narrower than the others, are first inserted, bolted up and temporarily supported till the circle is completed. A temporary wooden bulkhead retains the earth in front of its lower half while the upper half is being extended. The tunnel is at the same time being enlarged to its full dimensions, in sections of 10 feet, similar plates being used for retaining the earth above the springing line, and the plates supported by radial shores bearing upon the pilot tunnel. As the soil encountered so far is either a fair quality of not very fine sand, or of gravel interspersed with bowlders, it has not been necessary to extend the iron lining below the springing line. The sides or quarters of the invert are kept in place by plank, also supported by radial struts bearing on the pilot. The bottom of the invert needs no support. The rear end of the pilot, which is constantly removed as the forward end advances, is supported on the finished brickwork of the sewer; the pilot is kept about 30 to 35 feet in length. For supporting the 10 feet of tunnel excavation to full size in advance of the brickwork, the pilot acts in a great measure as a girder, its own main points of support being the brickwork in the rear and the undisturbed ground in front.

The centering for the brick lining, also supported upon the pilot, is composed of ribs made of two pieces of angle iron riveted together, and covered with the usual lagging. The brickwork (the outside plates remain in the work) is intended to be 16 inches thick for the 12 feet to 15 feet sections, but owing to a little irregularity in fixing the plates its thickness is in some places increased to 20 inches and even 24 inches.

But little water has as yet been encountered, and it is readily pumped by hand, from the excavation in front of the brickwork, to a trough which delivers it into a dump at the shaft where it is handled by a pulsometer. A 12-inch drain pipe beneath the sewer was provided for in the plans, but has not been found necessary. Considerable of the earth excavated is being left in the bottom of the sewer till its completion, and upon this is laid the track for the dump cars which convey out the material excavated, and bring in the brick, cement and other supplies. The mortar is mixed below.

There will be eight shafts sunk in all, and at each of them will be built a manhole through which the overflow of the existing sewers, during storms, will be delivered to the relief sewer, According to the plans the connections will be curved both laterally and vertically, the sills at their junction with old sewers, placed at the proper heights to allow all ordinary sewage to flow in the old channels without being diverted, and one wall of the connections constructed so as to cut off all flow in the old sewers which exceeds this amount. Thus far only three shafts have been sunk—viz.: at Dean Street and Fourth Avenue with a depth of 31 feet; at Hanson Place and Flatbush Avenue, 44 feet in depth; and near Fulton Street, 67 feet in depth. At all of these points the work of driving the tunnel is in progress. Work has also been commenced at the lower end of the sewer. A foundation of two courses of 4 inch plank, in the soft ground there encountered, is first laid. On this the side walls and invert are built of rubble, with an 8-inch brick lining. The sewer at its outlet will first empty into a settling basin, 60 feet by 84 feet in size, with its bottom 8 feet below high tide. Here sand, gravel, etc., will be intercepted and screens for catching floating matter put in if found necessary. The basin outlets are to be trapped from the canal.

The tunnel work is in charge of Assistant Engineer L. Russell Clapp, the portion in open cut in charge of Assistant Engineer David F. Brower, for which Swain & Keeney are the contractors, and the whole work is under the supervision of the Department of City Works, of which Robert Van Buren is Chief Engineer.

BRICKS FROM WASTE OF PLATE GLASS MANUFACTORIES.

As is well known, plate glass is ground by means of wooden plates covered with iron, between which quartz sand, abundantly moistened with water, is brought.

By the manipulation of grinding, which consists of a constant moving to and fro of the grinding plate over the plate to be ground, the quartz sand becomes mixed with particles of iron and sand, and after it has lost its sharpness is piled up near the manufactory as worthless material.

According to *The Brickmaker*, this waste material may be utilized in the manufacture of bricks. The sand, as stated, contains about 15 per cent. of glass particles and 2 per cent. of iron particles. It is very hygroscopic, and before it can be used for the manufacture of bricks has to be dried, and is then pressed into the mold under a pressure of 660 pounds per 0.155 square inch. The pieces thus obtained are subjected to a temperature of 2732° Fahr. At this high temperature the glass enters into a combination with the sand, a new product with new properties being thereby obtained. The bricks thus produced have a specific gravity of only 1.5; they are perfectly white and are not attacked by acids, and for this reason would be especially desirable for use in factories of chemical products, particularly in factories of sulphuric acid. hey also resist frost. Regarding the strength of the material, experiments have shown them to possess a compressive strength of from 840 to 975 pounds per 0.155 square inch By mixing the sand, enameled bricks showing beautiful colors are obtained, which may be used for decorating fronts and interiors.

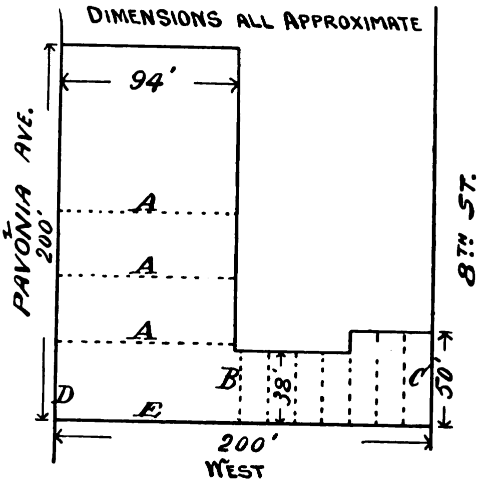
ACCIDENT TO THE NEW WELLS, FARGO & CO. STABLES AT JERSEY CITY.

A FATAL accident occurred on the morning of the 22d inst. at the new stable building of Wells, Fargo & Co., at Jersey City, N. J., now in process of construction, by which ten persons were injured, two of them fatally, while the recovery of a third is doubtful.

The building has a frontage of about 200 feet on Pavonia Avenue, with a depth of 94 feet, and has an ell from 38 to 50 feet in width, extending back to Eighth Street, the ell being a little over 200 feet deep. It is three stories in height. The walls of lower story are 20 inches and of the two upper stories 16 inches thick.

The floors are carried by iron girders, supported on the walls and on intermediate iron posts. These iron girders and the wooden floor beams were all in place for the second and third stories, but no flooring was laid.

At the time of the accident the roof trusses from B to C, in the ell, were in place; and, as stated by Mr. Post, of the firm of Post & McCord, contractors for the iron and roof work, three of the long span roof trusses, A A, were set up and connected both with each other and with the gable E by the full complement of trussed purlins; and part of the jack rafters were up. The trussed purlins bearing on the brick gable E were all anchored to the brickwork and the wall completed with a stone coping. A fourth truss was on the lower floor about ready to be hoisted, but no strain had yet been put upon the falls of the lifting derrick.



The accident seems to have been caused primarily by a heavy gust of wind from the westward, which threw down a section of the wall E for about 90 feet in length from the corner in the upper story and 40 or 50 for the second story, the lower story being uninjured, The brickwork fell partly within and partly without the building, the weight of brickwork and trusses carrying away both floors. As the iron girders of the second floor were anchored to wall girders built in over the arched doorways, the fall of the floor tore out one bay of the front at D. The mason work is of good quality; the bricks are very good, and the mortar appears to be fairly good, lacking, perhaps, a little in adhesion to the brick, but as the fallen wall was recently built, and the distance to the ground considerable, very good adhesion was not to be expected after the concussion produced by the fall. The portion of west wall still standing is in good alignment.

The wall itself, however, is pretty light for one of such length (fully 200 feet) and height, without cross walls. The New York City building laws would have required at least 4 inches more thickness for upper and lower stories, and 8 inches more for the middle story. When the heavy gust of wind came, it struck with its full force against a wall 200 feet long, over 90 feet of which were entirely unbraced above the third floor (a height of over 20 feet, besides the gable), the three roof trusses in place offering little resistance; and the work being still green it proved too much for it. There seems to be no other reasonable explanation for the disaster.

REFERRING to the pumping machinery at the Cornell University water works, mentioned in our issue of November 15, as being essentially of the Worthington type, the Gordon Steam Pump Co., of Hamilton, Ohio, writes that they furnished to the Universiy in August, 1883, one hydraulic engine with 17-inch power cylinders, 7½-inch outside, packed plunger pumps, 10-inch stroke. In August, 1886, a duplicate of this was furnished.

THE WATER SUPPLY OF PARIS.

IN the course of an article dealing with the sanitary condition of Paris, as affected by the present systems of water supply and sewerage, the *Engineer* recently made the following remarks:

"There is no Government department which has been more active in France during the past few years than that of public works; and the engineering enterprises undertaken under its auspices have undoubtedly done much to develop the internal resources of the country. But little has been done in the important matter of sanitation; and at the present moment Paris, with its magnificent highways and bridges, is provided with a system of sewerage of the most primitive order. Ineffective sewerage and a bad water supply are, in truth, the principal factors in determining the very much higher death-rate of Paris than of London; and to realize how bad these are, it is only needful to regard this discrepancy in the mortalities of the two cities, in relation to the fact that the other conditions of Paris are far more favorable to a low death-rate than are those of London, The question of the Parisian sewerage will have to be dealt with before very long; but works are at present in train for providing a more satisfactory water supply. A good deal of progress has already been made towards this end, of which the latest step was the recent construction of the reservoir at Montmartre.*

"Even during the past summer, however, the inconveniences of the present system of water supply have been severely felt. The service of pure spring water carried by aqueducts into the city is not sufficient to meet all the necessities of Paris; and when it is found insufficient—a thing which generally occurs during the hot and dry months of the year—it is necessary to substitute Seine water for some weeks together. This step has been taken this year, and the discontent which it evoked perhaps had something to do with inducing the Chamber to approve the long-debated scheme for bringing an adequate supply of "source" water into Paris. This is to be done by means of an aqueduct, which will transport the waters of the two small streams, the Avre and the Vigne, from their source in the department of Eure-et-Loir into Paris. The plans for this work have now been all prepared, and the necessary legal steps for the acquirement of land have been taken. The aqueduct will run through the two departments of Eure-et-Loir and Seine-et-Oise, and will discharge into an enormous reservoir to be built at Montretout. The most interesting part of the work, from an engineering point of view, is the tunnel which is to convey the water under the heights of Marly and the Park of St. Cloud. This tunnel will commence upon the borders of the Park of Versailles, and will run as far as Villeneuve-l'Elarg—a distance of about 4¾ miles. Its depth below the ground will, in some parts of the route, exceed 215 feet. Work has already been commenced on this portion of the undertaking. Fifteen shafts have been sunk at distances of about 550 yards. This preliminary work has not been carried on without difficulty. If is found that the sandy soil of which the hills on the west of Paris are composed is completely permeated with water at a little distance from the surface. Operations are therefore carried on by sinking a metallic lining, consisting of two concentric cylinders, secured together by iron braces, and strengthened by masonry. At the bottom the two cylinders join; and they terminate in a steel attachment with a cutting surface, which sinks into the wet sand under the weight of the cylinders. Inside this tube, which is 10 feet in depth, workmen can safely carry on the work of removing the soil; and with its progress the tube is lengthened out by the addition of new ones. Other noteworthy features of the works in connection with the scheme are the construction of an iron aqueduct across the Seine bridge, the erection of new machinery at Clichy, the laying of an extensive series of pipes through Paris, and the building of the Montretout reservoir. This reservoir will contain three compartments on the same level, each of them holding 4½ million gallons of water; and the entire capacity of the reservoir will be sufficient to supply Paris for three days. It will be covered with brickwork arches turted over. On the whole, it may be hoped that the Parisians are at last in a fair way to escape from the compulsory limitation of water consumption to which they have so long been condemned."

COMMANDER MELVILLE, Engineer in Chief of the Navy, makes out a strong case in his annual report in arguing for a reorganization of the Engineer Corps upon a basis more appropriate to the modern condition of naval science. He says that the number of engineer officers is now 194, of whom four have not had the proper engineer education, and two at least did not wish to be appointed in the Engineer Corps. He holds that a much larger number of officers is needed in the Engineer Corps, and also a better couse of instruction for the young men who are each year appointed into it.

THE United States armor-clad cruiser "Maine" was successfully launched at the Brooklyn Navy Yard, at noon on Tuesday, November 18. This is the first launch that has taken place at the Brooklyn yard since that of the unfortunate "Trenton" in 1876, and the "Maine" is the first of the latest type of iron-clad to be launched in a United States Navy Yard.

BUILDING CONSTRUCTION DETAILS.

No. XXXV.

(Continued from page 394.)

THE CHICAGO AUDITORIUM.—PART III., HINGED CEILINGS.*

FIGURE 24 is a plan, to reduced scale, of the ceiling. which is raised and lowered in sections.

Figure 23 is a vertical section and elevation at Z Z, Fig. 24, and shows the arrangement of hinged ceiling T (Fig. 1, page 296, Vol. XXI.), The double girder E¹ is suspended from roof truss J by rods A, and to it are attached the hinges C C, etc., at intervals of about 15 feet, corresponding to the separate sections of the ceiling, which are revolved by hoisting chains at D D, etc. B and B are 10-inch lattice girders.

Figure 25 is a vertical section at elevation at Z Z, Fig. 26, and shows the arrangement of hinged ceiling Q, Fig. 1 (page 296. Vol. XXI.).

Figure 26 is an elevation from X X, Fig. 25, of part of the ceiling, which is symmetrical about the center line C C, and has a total length of 87 feet 2 inches.

Figure 27 shows the detail at hinge A, and Fig. 28 shows the pattern of single and double hinges.

The ceiling is partly counterbalanced by weights W, and is hoisted and lowered by crabs D, each having a capacity three times as great as their estimated duty. B B, etc., are 1"x1" tee bars, spaced 12 inches apart.

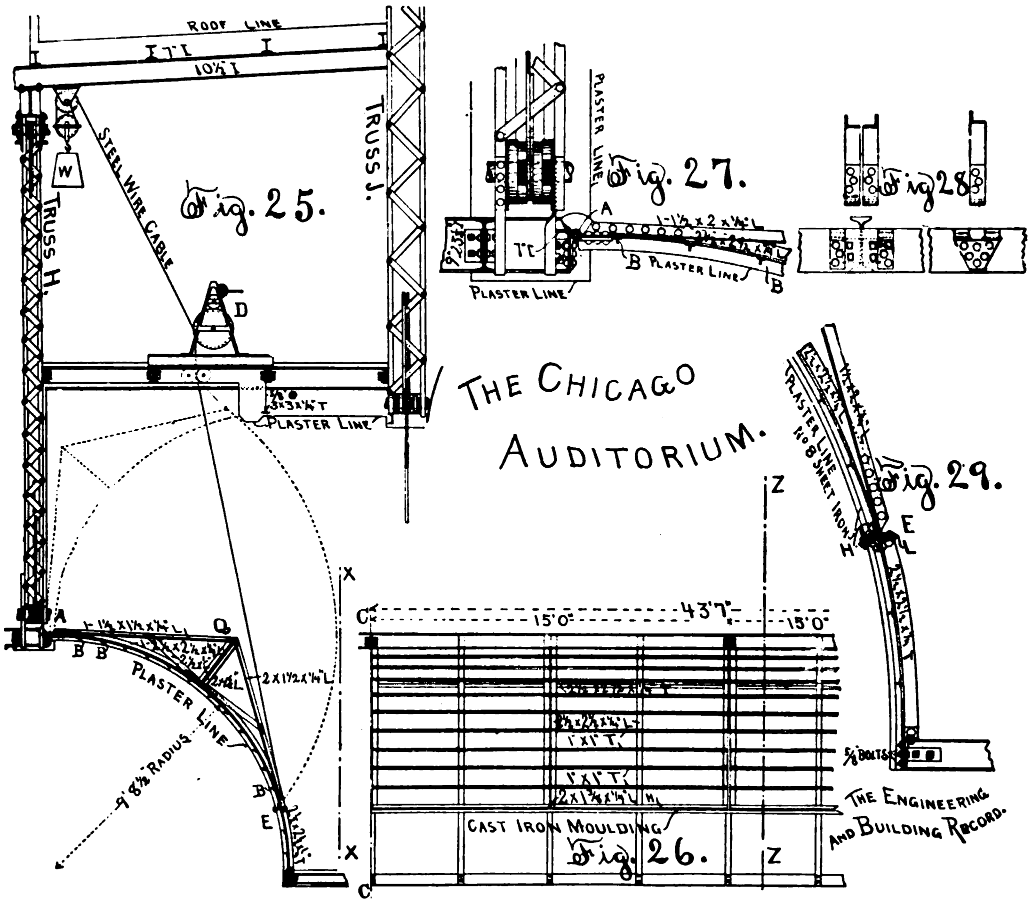

Fig. 25. Fig. 27. Fig. 28. Fig. 29. Fig. 26.

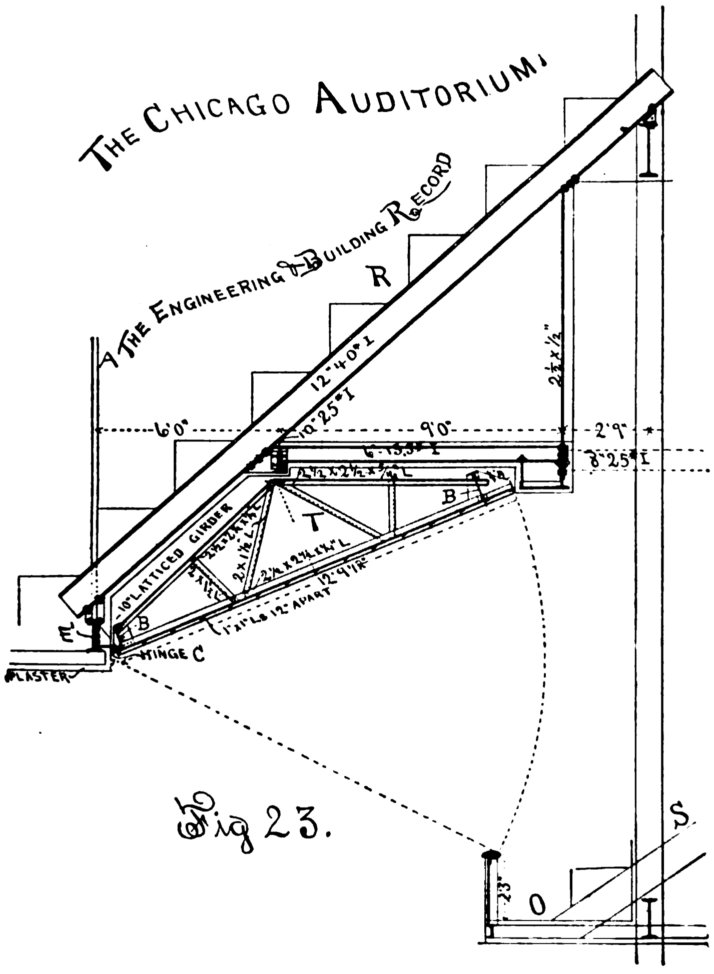

Fig 23.

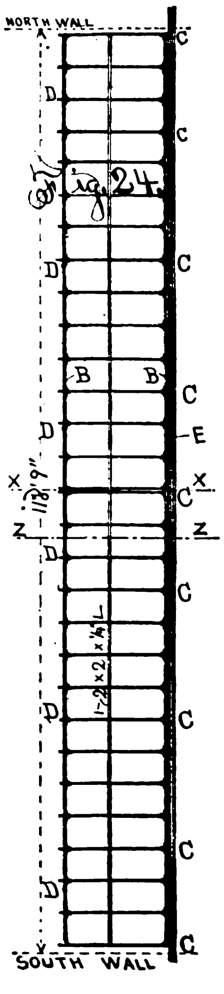

Fig. 24.

When closed the lower edge of this ceiling frame rests at E on the top of the rail in front of balcony R, Fig. 1.

Figure 29 shows the detail of the seat at E. H is a continuous longitudinal angle revolving against the cast-iron seat plate L.

(To be continued.)

* Part I., General Description and Elliptical Ceiling was published April 12; Part II., Main Roof Trusses, was published November 22.

GOOD COUNTRY ROADS.

THE New Jersey law, which was passed two years ago, permitting the various counties of that State to issue bonds for the improvement of country roads, has led to movements in that direction in other States. There is no county in New Jersey, says the New York *Times*, in which the law has been given a fairer trial than in Union County. Bonds have been issued in that county to the amount of $300,000, and the money obtained by this issue will be sufficient to put in fine condition some thirty miles of country roads, extending in one direction from Elizabeth to Plainfield, and in another direction from Rahway to Summit.

The original estimate of expense for these improvements was $10,000 per mile, and to the credit of those who have had the improvements in charge, this sum has proved sufficient for them. The roads are now nearly finished, and for the first time in the history of Union County they are in condition for all sorts of travel in every season of the year. It is alleged that in bad weather one horse can now draw a load which required the strength of four horses before the improvements were made.

Chauncey B. Ripley, who was one of the projectors of the road law, said that it is the opinion of property owners in Union County that the issue of bonds for this improvement will really never be felt by the taxpayers. The taxes levied to pay the interest on these bonds are now lighter than were the expenses to keep the roads in repair under the old system. Since the law went into operation, moreover, real estate values in Union County have advanced nearly $1,500,000, exclusive of property advances in Elizabeth of nearly $700,000 more. While this increase is not claimed as all due to the improved roads, it is felt that this improvement may reasonably be credited with having already appreciated county values to the full extent of the cost of the roads, while general taxes are no higher than before the roads were laid.

Mr. Ripley quotes Warren Ackerman, who is probably the largest real estate owner in Union County, to the effect that the improvements cannot cost the present taxpayers a dollar, because by the time the bonds shall mature the increase of population and the appreciation of values will have been sufficient to pay for their redemption. As Mr. Ackerman expresses it, the bonds will be redeemed by taxes on valuations that do not now exist, and on persons who are not now residents of the county. Sheriff Glasby, who is also very much interested in the work, has expressed to Mr. Ripley opinions identical with those of Mr. Ackerman. He says that two years ago people were leaving Elizabeth because of the bad roads, but that the population is now increasing, and that the city is becoming attractive to people who like to drive and who are now enabled by the condition of the roads to enjoy that pastime.

The prominence given to Mr. Ripley in connection with this law and its execution has brought letters to him from various parts of the country which show an increased interest in this subject, and which promise to popularize the movement. Within a few weeks Mr. Ripley has received a letter from a gentleman for many years a member of the Pennsylvania Legislature. He wants a copy of the New Jersey laws and all printed matter relating thereto. He says that it is his purpose to devote his chief energies during the coming session to procure the passage of a similar act in his own State. This gentleman is also the owner of a newspaper, whose columns he intends to devote to the championship of this movement.

In Massachusetts a chair has been recently endowed at the Boston School of Technology to be known as the Chair of Public Roads. Mr. Ripley says that he has reason to believe that not only in Pennsylvania. Massachusetts, and New York—a society having recently been formed in this State to promote the improvement of public roads—has interest been awakened in this subject, but that there is hardly an Eastern or Middle State that has not taken on new zeal in the matter of the improvement of roads.

In Tennessee the Vanderbilt University instructs free of charge one person from each county to supervise roads. During the coming session of the Legislatures bills for this purpose will be introduced in Ohio, Virginia, Maryland and Rhode Island, in addition to the States mentioned. New Hampshire has recognized the importance of good roads in the White Mountain district by making State appropriations for the construction and repair of the principal county and town roads. Mr. Ripley was glad to notice during a visit to Maine last Summer, that increased attention is given to the condition of the roads in Bangor, and that at Bar Harbor the town authorities have become convinced that if they are to maintain that place as a favored summer resort they must provide good roads for the summer visitors.

THE POTTSTOWN, PA., NEW WATER-WORKS.

The new water-works at Pottstown, now in course of construction by the Pottstown Water Company, to give the town a larger and better water supply, will cost about $120,000. The water basin is a parallelogram 320 by 200 feet, is divided into two compartments, with an average depth of 13 feet; walls 9 feet thick at the bottom and 3 feet at the top, with 6-inch coping. The basin will have a capacity of 5,000,000 gallons. Water will be taken from the Schuylkill by a 30-inch pipe opening into an archway 3 feet wide by 4 feet and 3 feet high, leading to a pumping well 12 feet in diameter. The pipe is laid to the botton of the river, and extends at a grade into the well, so that water can be obtained at the lowest stage of the river. The water is forced up from a 24-inch main into the reservoir, from which a 20-inch main leads to the town for distribution. The available head of water will be 163 feet.

STREET CLEANING AND DISPOSAL OF REFUSE.

With the object of ascertaining the methods adopted for cleaning streets and disposing of street sweepings and other refuse (ashes, garbage, etc.), and the cost of the same, The Engineering Record recently sent out a number of circulars to the cities and larger towns of the United States asking for information upon this subject. The form of circular issued was one suggested by Mr. Sylvester H. Martin, Chief of Bureau of Street Cleaning, Philadelphia, given in the number for August 9, 1890.

The data furnished in the replies do not enable us to give the cost of street cleaning with as much accuracy as we hoped to be able to do. In many of them the cost is not given, or cannot be separated from the repairs. Many places have few or no paved streets, the frequency of cleaning is indefinite, or it is done quite irregularly, in some cases by the abutters, the city or town only carting away the sweepings. It is frequently uncertain how much, if any, of the amount charged to cleaning may have been expended on unpaved roads. In some of the returns, under the head of "width of main streets," has been given the width of paving only, and in others that of the entire street.

Table I. gives a summary of the data received relative to the cost of street cleaning in 32 places, from which the returns are more complete.

The replies to the other queries of the circular are summarized as follows:

DISPOSAL OF STREET DIRT.

Used for filling low places and private lots, or for grading streets and park grounds	54	cities	and towns
Part used for filling and balance taken out to sea.	3	"	"
Delivered at waste dump or garbage ground.	9	"	"
Hauled out of the city or town	6	"	"
Thrown into the river	2	"	"
Used as fertilizer	1	"	"
Sold for fertilizer	3	"	"
	78		

CLEANING CATCH BASINS.

Cleaning weekly	3	cities	and towns.
" bi-weekly	1	"	"
" monthly	6	"	"
" bi-monthly	2	"	"
" quarterly	5	"	"
" 3 times a year	1	"	"
" semi-annually	7	"	"
" annually	4	"	"
" 1 to 2 times per week (Lowell)	1	"	"
" 8 to 10 times per year	1	"	"
" 6 to 12 times yer year	1	"	"
" weekly in winter and monthly in summer (Los Angeles); summer is dry season	1	"	"
	33		

The above are given in many cases as averages, and it is stated in several of them that the basins are cleaned oftener if necesarry. From the remaining places a few make no return or say that they have no sewerage system, and others report, "cleaned after every storm," "as often as necessary," "when choked up," or "at no regular time."

For the cost of cleaning, 32 report having no data; only 26 give any statement of cost. For these the annual cost of cleaning each basin ranges from 30 cents to $11.71, the average of all being $4. For two-thirds of the number the prices range between $1.46 and $6, with an average of $3.62. It is possible that three or four of the larger amounts may include cleaning of sewers, though it is not so stated.

REMOVAL OF ASHES.

Daily removals	8	cities, etc.
Three times per week	2	"
Two times per week	9	"
Weekly	16	"
Bi-weekly	2	"
Monthly	1	"

Some of the above report that on business streets, in the center of the city, the removal is effected oftener. Washington reports removal from 2 to 6 times per week; Chicago reports removal daily, 2 and 3 times per week; Boston reports removal from dwellings weekly, stores semi-weekly, hotels and markets daily.

This makes 41 reports in all. In the remainder no return is given, or it is stated that the removal is left entirely to the householders; in some cases, however, it is under the supervision of the police or health officers, who interfere if it is neglected too long.

DISPOSITION OF ASHES.

Used for filling low places and private lots, or for grading streets and park grounds	53	cities, etc.
Part used for filling and balance taken out to sea	3	"
Delivered at waste dump or garbage ground	11	"
Hauled out of the city or town	7	"
Thrown into the river	4	"
	78	

REMOVAL OF GARBAGE.

The frequency of garbage removal is given as follows:

Daily removal	13	cities, etc
Three times per week	7	"
Semi-weekly	12	"
Weekly	9	"
Bi-weekly	1	"
Daily, in summer	2	"
Semi-weekly, in winter, and 3 times a week in summer	7	"
Daily, 2 and 3 times a week (Chicago)	1	"
	52	

Of the above, three report that garbage is removed daily from markets, stores and hotels and restaurants. In five of the returns no statement is given, and in the remainder it is said to be left to the householder, controlled by the police or health authorities.

DISPOSAL OF GARBAGE

Used for fertilizing fields or manufactured into fertilizer at a factory	5	cities, etc.
Sold to farmers, or used for feeding hogs	16	"
Burned or cremated in a refuse destructor	5	"
Delivered at city dump or garbage ground	9	"
Hauled outside the city	8	"
Rotted outside the city	1	"
Treated with lime	1	"
Buried	4	"
Dumped into the river	7	"
Carried out to sea	2	"
Disposed of by contractor	3	"
Used for grading lots, etc.	10	"
	71	

One of the above reports the garbage as partly burned on the city dump, along with ashes and street dirt.

REMOVAL OF DEAD ANIMALS FROM THE STREETS.

Removed by contract at expense of city or town	29	cities, etc.
Removed at expense of city by Street Commissioner or other city official, or by order of the Board of Health	36	"
Removed at expense of city, and cost recovered from owner of animal, if found	4	"
Contract made for removal without cost to the city for value of the animals	7	"
City receives a small price from contractor for the privilege of collecting dead animals	2	"
No provision made, but left to owners or other private parties to remove them	8	"
	86	

In St. Louis the city receives $50.15 per month for the privilege of collecting.

DISPOSITION OF DEAD ANIMALS.

Buried	33	cities, etc.
Delivery to rendering, glue, or desiccating works, or manufactories of fertilizers	21	"
Buried or cremated	2	"
Used as fertilizer	3	"
Thrown into Missouri River	1	"
* Deposited in garbage grounds or dump	3	"
Hauled out of the city	5	"
Left to decay in the fields	2	"
	70	

Machine sweepers are reported as being used for more or less of the street sweeping in 35 places.

---

* In one case partly burned.

Table I.—Cost of Street Cleaning.

Name of City.	Population.	Character of Pavements.				No. Width of Main Streets.	Frequency of Cleaning.	Annual Cost of Cleaning
		(h) Block, Asphalt, etc.	Cobble.	Macadam	Gravel or unpaved.			
		Miles.	Miles.	Miles.	Miles.	Feet.		
New York	....	325.2	5.1	25.5	41	60 and 100	One-third daily; one-third tri-weekly; one-third bi-weekly	$1,255,835.00
Philadelphia	1,050,000	261.1	392.2	96.0	...	50	Once a week	425,042.00
Brooklyn	852,000	86.5	280.4	...	....	60 and 70	Part daily, balance tri-weekly	340,000.00
Boston	450,000	53.0	8.0	172.0	159	40	Principal streets daily; others two and three times a week	150,000.00
Omaha, Neb	134,752	(a) 52	....	....	315	100	Weekly, but not very regular	20,000.00
Kingston, N. Y.	22,000	1	¼	3¾	38	50	Weekly	2,000.00
Duluth, Minn	35,000	3.7	....	44	46	66	Paved, daily; others, occasionally	5,000.00
Jersey City, N. J.	163,000	27.5	10	1½	102	60	Some weekly, others once in two or four weeks	26,000.00
Erie, Pa	40,000	10	....	....	90	60 to 100	Quarterly	2,000.00
E. Saginaw, Mich	60,000	25	1	1	113	66	Semi-weekly, sometimes oftener	(b) 6,000.00
Springfield, Mass.	43,700	1	....	15	100	50	Block daily; other streets depending on location	7,100.00
Schenectady, N. Y.	22,000	3.5	12	½	50	70	Main streets weekly, side streets bi-weekly	2,000.00
Decatur, Ill	18,000	8	....	2	50	60	Paved streets weekly	3,000.00
Hoboken, N. J.	....	21	....	....	14	50 to 100	Weekly	4,000.00
Chelsea, Mass	28,000	1.5	....	5	34	50	Block semi-weekly, macadam monthly	2,000.00
Cohoes, N. Y	24,000	3.1	....	...	25.1	60	Paved streets weekly	(c) 9,000.00
New Haven, Conn	85,000	4.8	0.1	27.8	107.3	50 to 65	Block once to twice a week, others occasionally	12,000.00
Dubuque, Iowa	35,000	0.9	....	34.6	80	64	Monthly, except in winter	6,100.00
Fresno, Cal	11,000	1	....	....	35	80	Daily	1,200.00
New London, Conn	13,800	4.8	0.2	3	8.5	33 to 80	Monthly	2,000.00
Haverhill, Mass	26,500	1.5	0.2	2.1	25	50 to 60	Block and cobble semi-weekly Macadam quarterly	1,000.00 300.00
Washington, D. C.	250,000	156.5	....	....	....	80 to 160	One to six times per week	83,852.99
Chicago, Ill	1,200,000	372.1	....	206	1,419.5	66	Monthly to daily	213,247.77
New Orleans, La.	250,000	38	33	....	455	50 to 60	"Goes on daily"	75,000.00
Minneapolis, Minn	200,000	24.6	...	....	775	80	Paved streets daily, if necessary	(d) 3,334.87
Newport, Ky	28,000	13.5	....	9	1.5	40	Semi-annually	5,000.00
St. Louis, Mo	450,000	50	...	220	300	80	Tri-weekly	149,795.56
Mobile, Ala	45,000	6.5	1	20	70	50	Daily	24,000.00
Los Angeles, Cal	50,000	7.8	....	1 5	80	80	Paved, two to three times per week	(e)
Lowell, Mass	78,000	9.8	...	10	110	50 to 70	Main streets daily } Paved Other streets weekly } Unpaved	8,000.00 9,000.00
Albany, N. Y.	98,000	18.3	35.8	1.7	..	(f) 36 to 57	Once or twice a week	8,000.00
Lawrence, Mass	44,505	2.3	....	2.8	70	50	Paved streets weekly	(g) 13,000.00

(a) Three miles of this amount are alleys.
(b) Cost for cleaning pavements only.
(c) Includes keeping bridges in repair.
(d) For sweeping.
(e) Paved streets per mile:
20 to 60 feet, $16.
60 to 80 feet, $18.
80 to 100 feet, $20.
(f) Between curbs.
(g) Estimated.
(h) In this column are included all the smoother surfaced pavements, including stone and asphalt block, sheet asphalt, brick and wood.

There seems to be decided room for public improvements in some of the places heard from, as, for example, in a city of Pennsylvania of over 25,000 inhabitants, which has no sewers and no regular cleaning of streets, and in a city of Kansas, of some 12,000 inhabitants, which has about 65 miles of streets, and only about ¼ of a mile of pavement (macadam). To places away from the natural gas region, the reply from Indianapolis, that they have *no ashes*, is a little startling.

IMPROVEMENT IN ELECTRIC PIPE WELDING.

In welding together pipes by the electrical method it has been the usual practice to employ internal mandrels to prevent collapse or change of circumferential outline. Prof. Elihu Thomson, however, has recently invented a simple process by means of which the use of internal fixtures is avoided. The invention is based upon the circumstance that if a hollow structure be heated at a certain portion of its length and subjected to an upsetting action it will bulge exteriorly instead of collapsing. The structure will, therefore, have a larger diameter at the swelled portion. In the present process, where it is applied to the welding of pipes, hammer blows are delivered at the weld or on the side of the pipe, and are so graduated as to simply contract this bulging of lateral spreading tendency. The hammering is delivered laterally so as to restore the metal back to its original position on the sides of the pipe. There is said to be no tendency to collapse on account of the bulge of the pipe acting as a sustaining support.

EUROPEAN INLAND NAVIGATION.

(Concluded from page 392.)

"The following table of canals and canalized rivers in the United States has been compiled with care, and it is believed to be substantially correct, the information contained in it being the result of an extended correspondence with the managers and engineers of the various waterways.

"As far as practicable the canals and rivers have been arranged in geographical order. Canals that are mere artificial channels without locks, have not been included, nor any canals that are not regularly or occasionally used for purposes of navigation:

"It should be borne in mind that a large number of canals that once existed have been abandoned, such as the James River and Kanawha Canal, the Beaver and Erie Canal, and many of the branches of the Erie Canal of New York. The future of several canals included in the table is uncertain, but only those have been omitted that have actually passed out of use as canals.

"In noting the differences between our country and France we are at once struck with the fact that while our canal mileage is steadily lessening, that of France is not only increasing year by year, but immense sums of money are being expended to widen and deepen old canals. An expenditure on canals alone of $73,000,000 since 1871, the greater part of which was borrowed at a time when France was staggering under the heavy burdens imposed by the war of 1870, may well cause us to ask ourselves if our policy of letting canals go to ruin and then abandoning them is not a grave mistake in political economy. It should also be noted that all the waterways of France are absolutely free, except a few that are burdened with ancient leases, and that from time to time the Government is condemning and buying in these leases, so that before many years the whole 5,050 miles of canals and canalized rivers will be free of dues. The justification for such liberality may be found in the estimate put forth by French political economists that the canals, even when free, pay 5 per cent. per annum in economizing the national wealth.

"In comparing our canals with French ones we find that even the Erie Canal has less capacity than the standard which has been adopted in France for all main lines, of which size of canal France already has a length of 952 miles. The true measure of the usefulness of a canal is the size of boat that can traverse it, and we see that while the French canals can pass a 300-ton boat the Erie can only pass a 240-ton boat. This disparity, however, will not long remain, as the State of New York is rapidly doubling the length of the locks on the Erie Canal, so that two boats connected, end to end, can be locked through at one time, thus increasing the tonnage capacity to 500 tons, or 200 tons in excess of the French standard. The additions to the locks are being made two feet wider, with a view to an ultimate change to locks having a width of 20 feet.

"If we look at the tabulated statement of the State canals of Ohio, we see that the capacity of the Ohio locks is only 90 tons. It is therefore not surprising that these canals are not flourishing, and that every year strong efforts are made to have them abolished as a dead weight on the Commonwealth."

Alabama is conducting a lively campaign in the interest of good roads. The newspapers of the State have taken the matter up and are keeping its importance prominently before the public.

CONSTRUCTION DETAILS OF THE ROCHESTER, N. Y., WATER-WORKS.

PART I. — SANITARY PROTECTION OF HEMLOCK LAKE.

THE water for a domestic supply for the city of Rochester, N. Y., is obtained from Hemlock Lake, a natural reservoir, about thirty miles from and 388 feet above the city.

The lake is about seven miles long and five-eighths of a mile wide. It occupies the northern extremity of a deep, narrow valley, which is fifteen miles long. In the southern part of the valley is situated the village of Springwater, having a population of about 600. The shores of the lake are bluff and steep, rising to a height of from 300 to 500 feet, and mostly covered with a growth of timber. The basin of the lake is deeply excavated in the formation known as the Marcellus Shale, lying above the limestone rock of that region.

In the Springwater valley, south of the lake and on the summits of the bluffs forming the boundary of the basin, are a considerable number of farms devoted to the usual purposes of agriculture. About the time at which operations were commenced to utilize Hemlock Lake as a source of water supply for the city, attention was attracted to the lake as a desirable point for summer residences, and there have been built on its shores over 100 cottages and several hotels or summer boarding-houses, with a summer population, including transient visitors, of from 500 to 700 persons.

The necessity for the efficient sanitary protection of this water-shed was self evident. Obviously the ideal method would be the purchase of the lake and its whole water-shed, and the removal therefrom of every habitation or shelter for man or domestic animal, including all farm and village constructions and improvements, and to restore the whole area to a state of natural wildness and savagery. But this plan was abandoned on account of the great expense involved, and because the lake must be preserved for public navigation, and because of disputed titles to the riparian rights.

The Legislature of the State was, therefore, induced to pass a general act entitled, "An act to confer upon the State Board of Health power to protect from contamination, by suitable regulations, the water supplies of the State and their sources." Under this act the State Board of Health was requested to, and did prepare and establish, rules and regulations for the sanitary protection of the waters of Hemlock Lake. These regulations provide, in substance, that privies, pig-pens and barnyards shall not be located over or adjacent to any stream, spring, or dry water-course, where the contents thereof can reach the same; that any privy situated within 50 feet of any spring stream, or dry water-course, or ravine, shall be constructed without a vault, and shall have under the seats water-tight receptacles for night soil, which shall be frequently removed, emptied, cleaned and returned, and the contents buried in the earth in such a manner that they cannot, by any possibility, reach any water-course or permanent level of subsoil water. No manufacturing waste is allowed to be discharged or drained into any spring, stream or dry water-course on said water-shed. The same restriction applies to the depositing of dead animals, birds, fish, decayed fruit, leaves, sawdust, roots, branches or trunks of trees in any spring, dry water-course, or into the lake itself. The washing of sheep or other animals in the lake or any of its tributaries is also prohibited.

The provisions relating to houses, cottages, tenements, tents and picnic grounds within 200 feet of the shores of the lake may be summarized as follows: Each is to be furnished with at least one privy set upon the surface of the ground, without a vault, and so constructed that metallic pails, 15 inches high by 14 inches in diameter, can be placed under the seats and easily removed with their contents. The occupants are required daily to add dry loam in small quantities, as a deodorizer and absorbent. It is made the duty of the occupant also, to provide a receptacle for dry garbage and to carefully place the same therein. All slop or wash water must be scattered upon the surface of the soil at a distance from the lake, or any ravine or water-course, and the points at which said slops are deposited to be frequently changed. Animal manures from stables are required to be carefully deposited in tight-covered receptacles and the contents thereof to be frequently removed.

The city of Rochester is required to furnish a sufficient number of metallic pails for the use of each necessary privy within 200 feet of the lake, and is required to remove, empty, cleanse and disinfect the same as often as is necessary. When a full pail is removed an empty one is to be supplied in its place. The pails during removal are to be provided with air-tight covers, so that no odor shall escape. The contents of the pails, together with the dry garbage, is required to be removed by the city to a point below the foot of the lake and there buried. As soon as possible after these rules were ordained and sanctioned by the County Judge, the city commenced operations thereunder, and has continued the same since that date. In practice, the night soil and garbage is collected and removed to the foot of the lake by means of a broad, flat-bottomed steamboat, the collections being usually made in the early morning. From the steamboat landing the night soil and garbage is transported on a tramway to the dumping ground, which is a plat of land owned by the city in a retired location 1,800 feet below the foot of the lake.

The treatment of the night soil and the garbage, on its arrival, is as follows: Narrow trenches are excavated, care being taken that the permanent level of subsoil water shall not be reached, and the contents of the pails are deposited therein in thin layers. It is then immediately covered with dry loam to a depth of about 6 inches. This process is repeated day by day until the trench is nearly filled, when the balance is rounded up with earth. A measurement of the location of these trenches is made and recorded, the surface cultivated and cropped, and after a suitable period the same land may be again used for a like purpose. A trench 500 feet in length has proved entirely sufficient for a single year's operation up to the present time, and as these trenches need not be more than 3 feet apart, it will be seen that but a small area need be provided for the purpose.

The cans, as fast as they are emptied, are taken to the sanitary building, which is provided with an elevated tank filled with a solution of copperas, as also all other necessary appliances for washing, cleansing, deodorizing and drying the cans. The cans are of heavy galvanized iron, and are

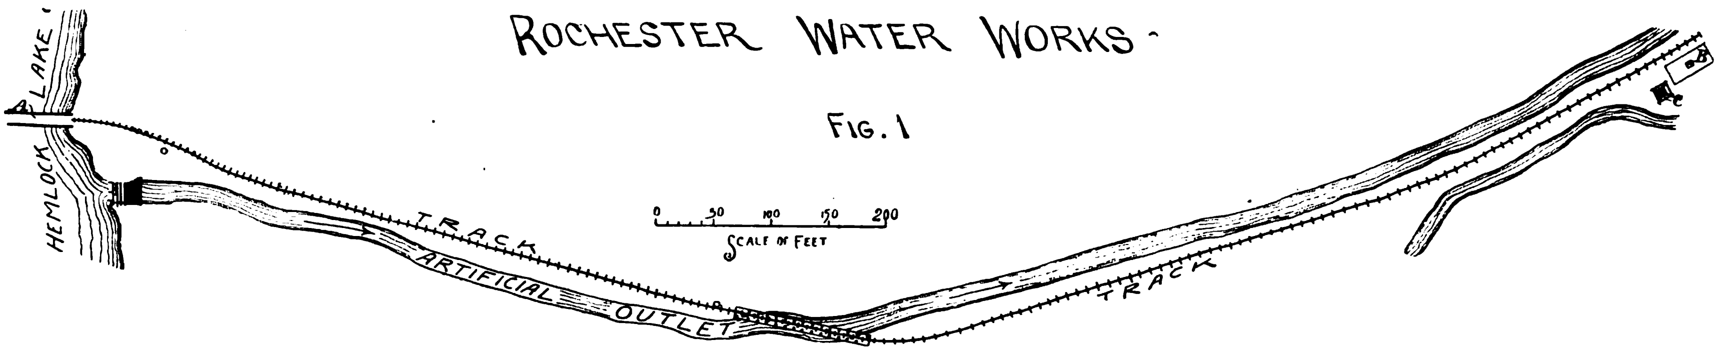

FIG. 1

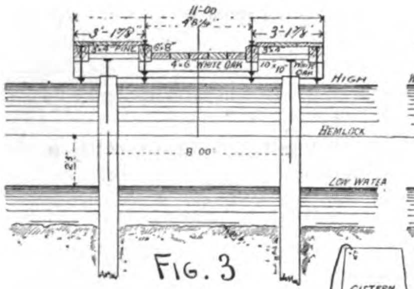

FIG. 3

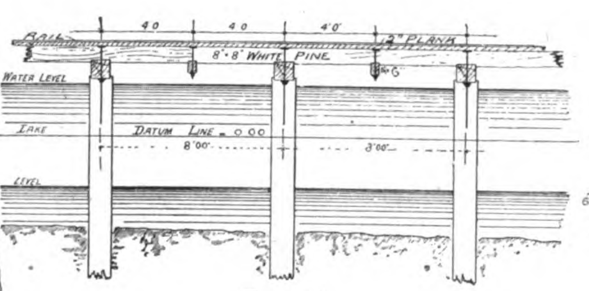

FIG. 4

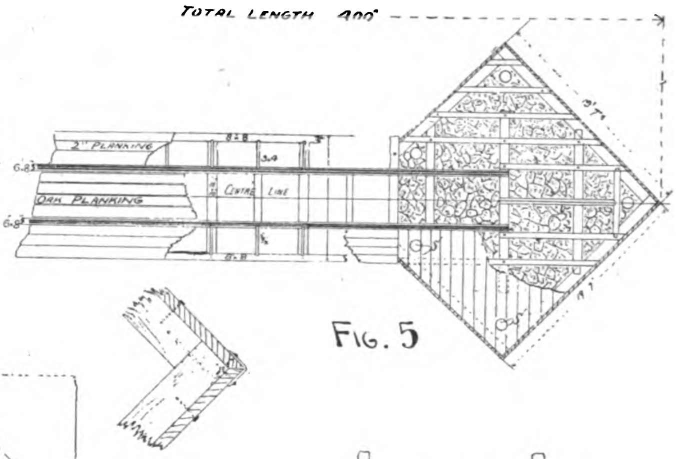

FIG. 5

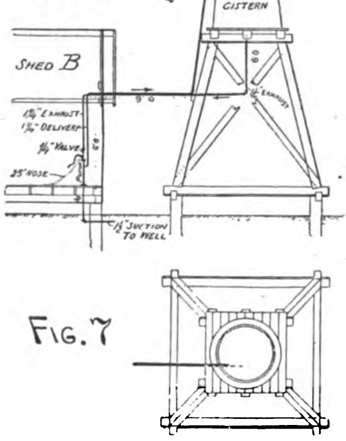

FIG. 7

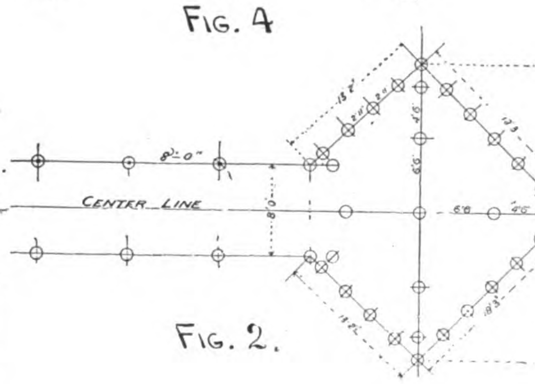

FIG. 2.

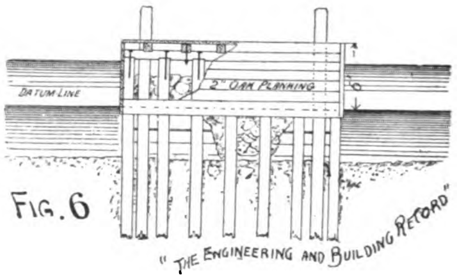

FIG. 6

"THE ENGINEERING AND BUILDING RECORD"

thoroughly coated, inside and outside, with black asphalt varnish. In the cleansing of the cans, if found necessary, other and more active deodorizing and disinfecting agents are employed. The process has been so conducted for several years that all local prejudice has subsided, and all fears as to possible offensive odors in the neighborhood allayed. In the sanitary building and about the grounds no offensive odors are discernible, although during the past year the contents of nearly 6,000 cans were thus removed and treated.

The results that have been accomplished thus far may be briefly stated : A great proportion of the residents about the lake have kept their grounds in a neat condition and maintained the sanitary purity of the water. Underbrush, logs limbs of trees and decaying vegetable growths are no longer thrown into the lake, nor allowed to litter the shores, but are carefully collected and burned. Privies, pig-pens, etc., away from the lake, but on the water-shed, have been removed from streams, ravines and dry water-courses and placed under such sanitary regulations and espionage as to render them unobjectionable. The local Boards of Health have become interested in these questions and their co operation secured. Animals which die upon the water-shed, and decayed putrescible matter of all kinds are no longer discharged into the nearest ravine, but are buried in the ground a distance therefrom. And finally, all night soil and dry garbage produced about the lake is collected and buried a long distance below the lake.

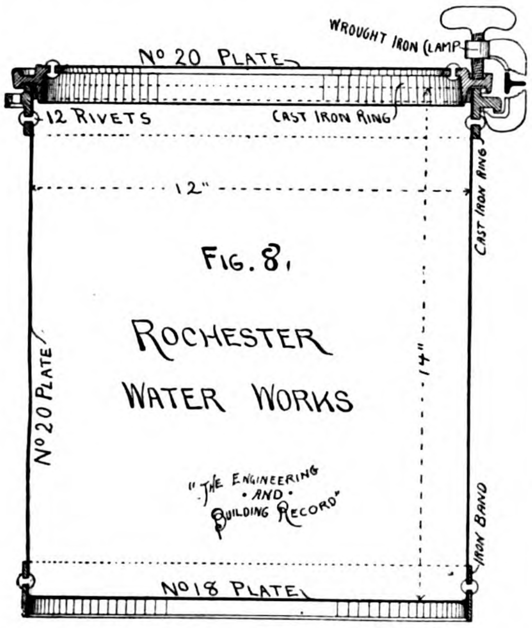

Figure 1 is a diagram showing the location of the steamboat landing A, washing shed B, and tank C. Figure 2 is a diagram of piling for the dock A and its pier head, the latter being shown in plan in Fig. 5, and in elevation in Fig. 6. Figure 3 is a cross-section, and Fig. 4 a side elevation of dock A, Fig. 1. Figure 7 shows the arrangement of the cistern, washing shed, pump connection, etc. Figure 8 shows the details of the iron service buckets.

The above description is chiefly condensed from a paper presented to the American Water-Works Association, by J. Nelson Tubbs, late Chief Engineer of the Rochester Water-Works, and the illustrations are prepared from drawings made in this office from the originals belonging to the Water-Works Department. In subsequent issues we shall describe the general features of the water-works system and illustrate special construction and standard maintenance details.

(To be continued.)

According to the Boston *Post*, James L. Anthony, C. Amory Stevens, Thomas McConn and their associates have filed with the Secretary of the Commonwealth of Massachusetts a petition to the Legislature, asking for incorporation as the Old Colony Ship Canal Company, for the purpose of constructing a ship canal from Buzzard's Bay to Barnstable Bay. Alfred D. Fox and his associates also petition for incorporation for the purpose of constructing a ship canal between the two bays above named.

St. Paul, Minn., has for some time actively prosecuted the work of putting electric wires underground. The results, up to the present time, have been satisfactory.

ELECTRIC POWER IN MAINE.

The great Penobscot River, the largest in Maine, drains 7,400 square miles, a region as large as the State of Massachusetts. From Oldtown to Bangor, a distance of 12 miles, the river falls more than 90 feet, giving several of the finest water powers in the world. These, says the Bangor (Me.) *Industrial Journal*, have mainly been used for the manufacture of lumber, but one of the finest is now to be used for a different purpose. At Veazie, four miles above Bangor, an electric plant has been building during the past year, that, when entirely completed, will be one of the largest in the world.

The building will be 240 by 52 feet, with a wheel house running the entire length, 23 feet wide, a boiler house 50 by 35 feet, and a tower 48 feet in height from foundation of the front of the building. The main building will be 32 feet high. The upper story will be leased to parties wanting room and power. Fifteen water wheels of 150 horse-power each will be placed in this plant and so arranged that they can be run separately or in groups. The power is transmitted to a main shaft, and connected with this will be two alternating machines for incandescent lights sufficient for 3,000 lights, four arc dynamos, and three power generators. About 100 feet in length of the building is completed, seven wheel pits are complete and six wheels are set. These are now in operation and light and power are being supplied to parties desiring either or both.

The plant will supply lights for the cities of Bangor and Brewer, power for the electric railway for Bangor and Brewer, and will also pump water for Brewer and Veazie. The ownership of the plant is divided as follows ; Three-fifteenths are owned by the Penobscot Water and Power Company, four-fifteenths by the Bangor-Street Railway, and eight-fifteenths by the Bangor Electric Light and Power Company. Power for motors will be let by the Electric Light and Power Company. The electric system used is the Thomson-Houston. For pumping water for supplying Brewer and Veazie, Henry R. Worthington, of New York, furnishes the pump, with a capacity of 2,000,000 gallons per day. The whole plant is thoroughly and substantially built of brick.

INSPECTION OF ELECTRIC WIRES AT BOSTON.

The Boston, Mass., Common Council has passed the following ordinance bearing on the supervision of electric wires throughout the city :

Section 1. A department of the city, to be known as the "Department for the inspection of Wires," and to be under the charge of the inspector of wires, is hereby created. Said inspector shall be appointed by the Mayor, subject to confirmation by the Board of Aldermen, for the term of one year, beginning with the first day of May in the year of his appointment, and until his successor is appointed and confirmed, and shall be paid an annual salary at the rate of $3,500 a year.

Sec. 2. Said inspector shall supervise every wire or cable over streets or buildings, and every wire within a building, when such wire is designed to carry an electric light or power current ; shall notify the person or corporation owning or operating any such wire or cable, whenever its attachments, insulation, supports or appliances are unsuitable or unsafe, or any tags or marks thereof, hereinafter described, are insufficient or illegible ; and shall remove every wire abandoned for use and every wire, except the wire of a street railway company used for the transmission of its motive power, or for the protection or support of such wires, which, after the expiration of six months from the date of his appointment, shall be unprovided with a tag or mark distinctly designating the owner or user of such wire or cable ; shall see that all statutes, ordinances and regulations relating to said duties, and to the location and removal of wires and cables in, over or under streets or buildings are strictly complied with and enforced.

Sec. 3. Said inspector shall, as soon as convenient after his appointment, make, and thereafter keep in his office, a map showing the location of all wires over, in, or laid under the streets and other public places, and over buildings of the said city, and a record of the names of the owner or owners of each and all said wires.

Sec. 4. Said inspector shall, when so required by the Mayor or Aldermen, examine every application for the erection of any wire, or poles or posts for the support thereof, in or over any street or public place, or for conduits under any street or public place for such wire, and shall report to them any facts which, in his opinion, bear upon the question of granting or refusing to grant such application.

Sec. 5. Said inspector shall have the charge and control of the erection and maintenance of all wires owned by the city, including the fire-alarm telegraph and police electric signal and telephone systems, and of the posts and other supports therefor now erected or owned, or hereafter erected by the city. He shall purchase and set up all the wires, posts, supports, and all the dynamos, machinery and other electrical appliances required by the city in all departments, and shall see that all the said wires, posts, machinery and appliances are maintained and kept at all times in good order and condition.

THE ADHESIVE POWER OF DRIFT BOLTS.

Some experiments on the adhesive power of drift bolts are described by John B. Tscharner in a pamphlet of selected papers of the Civil Engineers' Club of the University of Illinois.

The author states that probably the only information on the subject, thus far available, is the following in Baker's "Treatise on Masonry Construction": "In some experiments made at the Poughkeepsie Bridge, it was found that a 1-inch round rod driven into a $\frac{15}{16}$-inch hole in hemlock required, on an average, $2\frac{1}{2}$ tons per lineal foot (of depth) to withdraw it; and a 1-inch round rod driven into a $\frac{3}{4}$-inch hole in white or Norway pine required on an average 5 tons per lineal foot (of depth) to withdraw it." It was thought that a series of experiments made to determine more fully the following questions might, therefore, be of some interest:

1. The average holding power.
2. The relative holding power of pine and oak.
3. The best relation between the diameters of hole and bolt.
4. The holding power as the bolt is being withdrawn.
5. Relative holding power, bolt perpendicular and parallel to the grain.

The tests were made on a 100,000-pound Riehle's testing machine in the testing laboratory of the University of Illinois. The rods or drift bolts used were of steel, 1 inch in diameter and about 30 inches long. Holes $\frac{15}{16}$, $\frac{14}{16}$, $\frac{13}{16}$ and $\frac{12}{16}$ inches in diameter were bored in the face of the timber. Care was taken to get the holes as nearly perpendicular to the face of the piece as possible. The rods were driven with a sledge. In case the rod was found to be not quite perpendicular to the face of the stick when it was placed in the machine, small pieces of sheet-iron were placed between the timber and the bed-plate to make the bearing uniform.

To determine the average holding power a series of 45 tests were made by driving a 1-inch round rod into a $\frac{15}{16}$-inch hole in yellow pine, the depths varying from 3 to 12 inches. All were driven perpendicular to the grain of the wood. The mean of the several tests showed that it required 500 pounds per lineal inch of depth to withdraw one of the bolts. This result corresponds fairly well with the first series of experiments made at the Poughkeepsie bridge quoted above.

It was found, further, that the holding power of white oak is a little over three times as great as that of yellow pine.

In determining the best relation between diameters of hole and bolt, three series of tests were made in $\frac{15}{16}$, $\frac{14}{16}$, $\frac{13}{16}$ and $\frac{12}{16}$-inch holes, each series being in a single piece of wood. From the results obtained it was found that if we designate the strength in the $\frac{13}{16}$-inch hole as 100 per cent., that for the $\frac{14}{16}$-inch hole would be 79.7, 79.5 and 71.1 per cent. for the three series of tests, and that for the $\frac{15}{16}$-inch hole 47.4, 47.3 and 52.4 per cent., while the $\frac{12}{16}$-inch hole gives 52.5, 52.5 and 45.3 per cent. The holding power for the $\frac{13}{16}$-inch hole was greater than for any of the others, while common practice seems to favor a $\frac{15}{16}$-inch hole. It is possible that the fact that the bolt is harder to drive in a $\frac{13}{16}$-inch hole, and also more liable to split, may have something to do in determining the practice. However, in answer to the latter supposition, Mr. Tscharner says that in the 126 tests made, not a single crack in the timber was caused by the driving of the rod. The results clearly show that the elastic limit of the fiber of the timber is passed between the $\frac{13}{16}$ and the $\frac{12}{16}$-inch holes, as the holding power of the $\frac{12}{16}$-inch hole is almost the same as that of the $\frac{15}{16}$-inch hole. Hence, if we would utilize the maximum holding power of the timber, the author states that the proper ratio of diameter of the hole to that of the bolt would be 13 : 16.

In determining the holding power as the bolt is being withdrawn the method of procedure was as follows: The bolt was driven into the piece, placed in the machine, and power was applied until the rod slipped. This was recorded as "started," and the holding power at this point was read and recorded. The rod was then drawn out some fractional part of an inch, and the holding power again read and recorded. It was found that as motion begins, the holding power decreases very rapidly, and that when the rod has been withdrawn an inch the holding power is only about 20 per cent. of the initial resistance. After this the holding power decreases almost directly with the distance drawn out. The method of failure was almost in every case by a series of jerks and thuds, the holding power rising and falling in a series of waves.

As to the influence of the direction in which the bolt is driven—whether perpendicular or parallel t. the grain—it was found that the ratio between the holding power of a bolt driven parallel and that of one driven perpendicular is about as 1:2 This ratio was found to be nearly the same whether the timber was pine or oak.

BRICK-MAKING AT BAGDAD.

THE British Consul-General at Bagdad, in his latest report, has some interesting observations on brick-making in that town.

All Bagdad, with a population of about 116,000 souls, may be said to be built of kiln-dried bricks. Stone is little used there, as it is in Mosul, in house building, and, although the tenacious clay of Irâh gives good material, its use is confined chiefly to huts and agricultural squattings along the Tigris banks. There is thus an enormous demand for bricks. These are all hand-made and kiln-dried. There are about 25 large and small kilns at work, in the hands chiefly of Jews and Christians, but the turn-out is far behind the demand. Half-built houses sometimes remain so for long periods for want of bricks. The kilns are dotted over the desert outside the city. Often in spring, when the Tigris or Euphrates lays acres of ground under water, these stand like islands in the inundation, and brick-making is suspended. The bricks are carried from the kiln on small donkeys, each taking not more than 10 large or 25 small bricks. In the course of transit they get much broken, as the best, though good to look at and of a chrome yellow color, are very brittle. Another great promoter of the demand for bricks is the absorption of water every winter, bricks suffering equally with the mortar in which they are laid, owing to their porousness. Thus there is hardly a house, or wall, or brick pathway in Bagdad which does not constantly call for patching or rebuilding with new bricks. The old city walls, thrown down about 1870 by Midhat Pasha when Governor-General, remain still, in spite of years of burrowing and abstraction, a mine of broken bricks. Under a late *regime* it was said that the right of taking these away and selling them was conferred as a substitute for pay on the soldiery; but at present all classes seem to help themselves to them. These remarks serve to show what a good opening there is in Bagdad for brick-making after some simple but scientific method. Unskilled labor can be engaged to any extent just now at about 18 cents per diem for men and 10 cents for boys. Fuel is abundant.

Novelties.

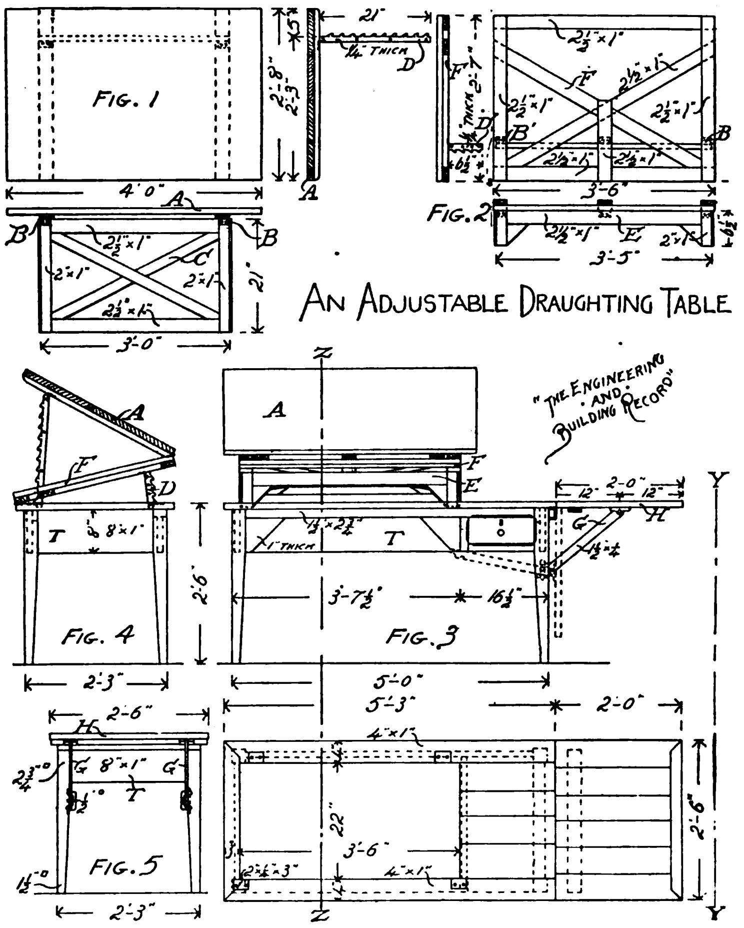
Devices are described under this head purely and strictly as news; because believed to be new and calculated to interest readers.

In no case is pay accepted, directly or indirectly, for publishing a novelty notice.

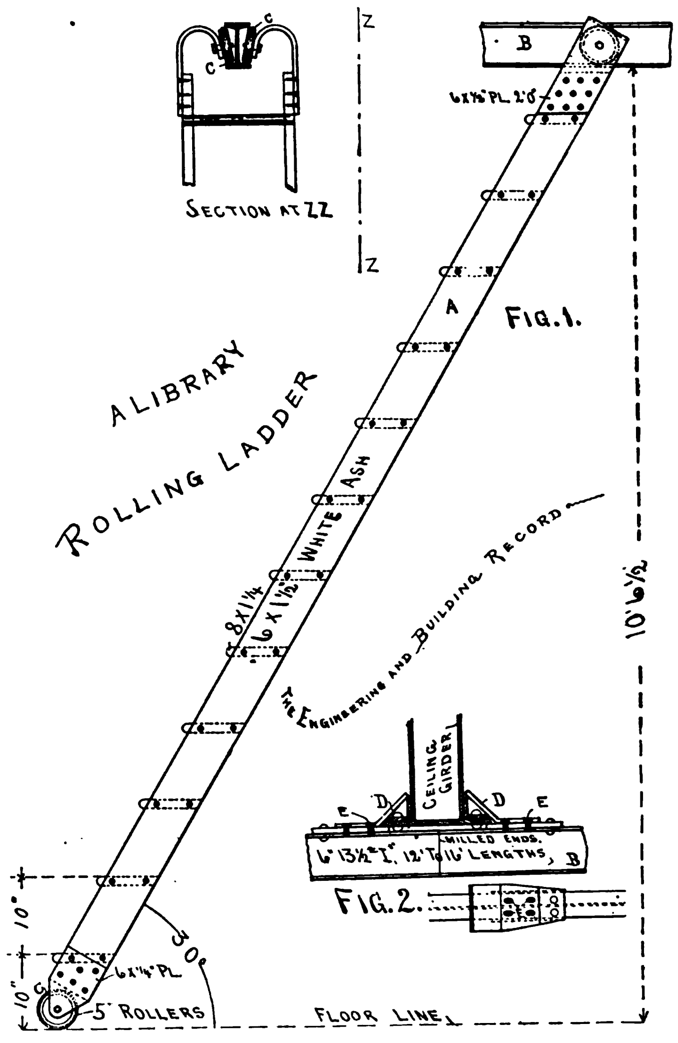
As the subjects are selected for their supposed novelty and interest merely, it will, of course, be understood that the selection does not imply indorsement.

AN ADJUSTABLE DRAUGHTING TABLE.

FIGURE 1 shows a drawing board A that may either be used on the independent table frame C, or attached to the frame E, Fig. 2, that is intended to be placed on the table T, Figs. 3, 4, 5. Fig. 3 shows a plan and elevation of frame E and board A on table T. Fig. 4 is a section at Z Z in Fig. 3, and Fig. 5 is an elevation from Y Y, Fig. 3. Board A has an independent adjustment by the hinges B B and bar D, and the top F of frame E has another adjustment, also independent, by its hinges B′ B′ and bar D′ H, Figs. 3 and 5, is a drop leaf supported by the braces G G. This table was designed by M. J. L. Towler, for use at the Detroit Bridge Works.



An Adjustable Draughting Table



A Library Rolling Ladder

A LIBRARY ROLLING LADDER.

FIGURE 1 is a side elevation of one of several rolling ladders recently designed and constructed by the Pittsburg Bridge Company for use in the Allegheny Court-House, where convenient access was desired to long rows of high shelves.

Light iron beams, B, parallel to the shelves, were attached to the floor girders of the story above, and on their lower flanges the top rollers of the ladders were carried, their axis being set parallel to the flange surfaces. The bottom rollers had no special track but ran freely on the bare floor. All the rollers had concave edges into which rubber rings C were sprung to make them run smoothly and quietly.

The track beams B meet each other in very close butt joints and are conveniently attached to the girders, without any drilling or fitting, by the use of the iron clamps D. These have slotted holes, E, permitting them to be set exactly and then bolted tight.

IT is reported that for the first time in many years a general flushing of the sewers in the Mission district, San Francisco, is in progress. The diphtheria raging in epidemic form in that section is attributed to the filthy condition of the sewers.

BOOK NOTICES.

SEWAGE DISPOSAL WORKS: A Guide for the Construction of Works for the Prevention of the Pollution by Sewage of Rivers and Estuaries. By W. Santo Crimp. Published by Charles Griffin & Co., London; 1890.

The author of this book was for a long time connected with the Wimbledon Sewage Works, and is now Assistant Engineer to the London County Council. He states that his main object has been to meet the want for an illustrated guide to the construction of sewage works, by bringing together the plans and details of some of the best examples of such works which have been carried out. Accordingly, after about 120 pages of introductory matter the bulk of the work is given up to descriptions and plans of sewage farms and works at twenty different places in England, and of the sewage precipitation works at Dortmund, Germany.

The English works include those of Bedford, Birmingham, Doncaster, Coventry, Ealing, Swanwick, Beddington, Chiswick, Bradford, Salford, Portsmouth, Wimbledon and others, illustrating ordinary sewage farming, intermittent filtration, and various chemical and precipitation processes, the whole being well illustrated and accompanied with useful information as to cost, results, character of effluents, etc.

The author is not an advocate of any particular process, but appears to be inclined to take the most favorable view possible in each particular case and to accept the statements of patentees without much criticism. This is especially the case in his remarks on the treatment of sewage by electrolysis, which he thinks is one of the most promising of all methods—but in regard to which he has only the statements of the patentee to give as evidence. The book is one which we commend to the attention of municipal engineers as a useful addition to their libraries.

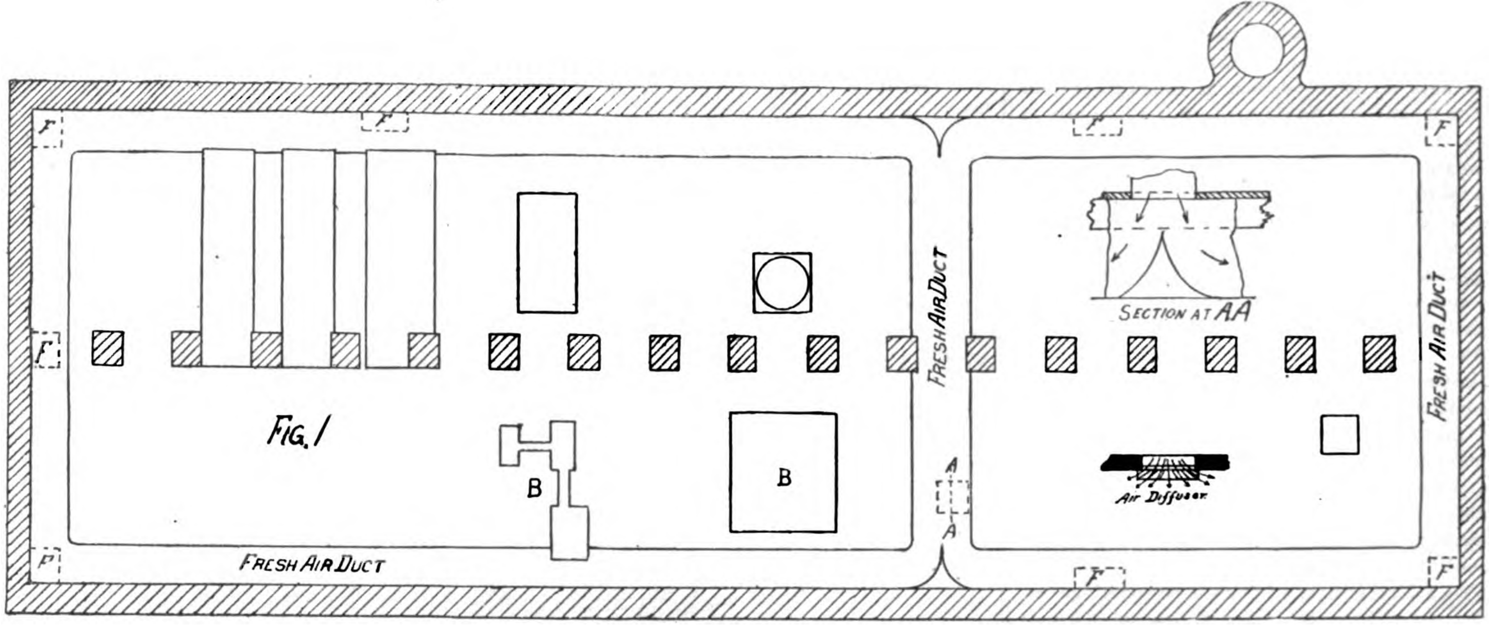
MUNICIPAL ENGINEERING. By W. D. Clark.

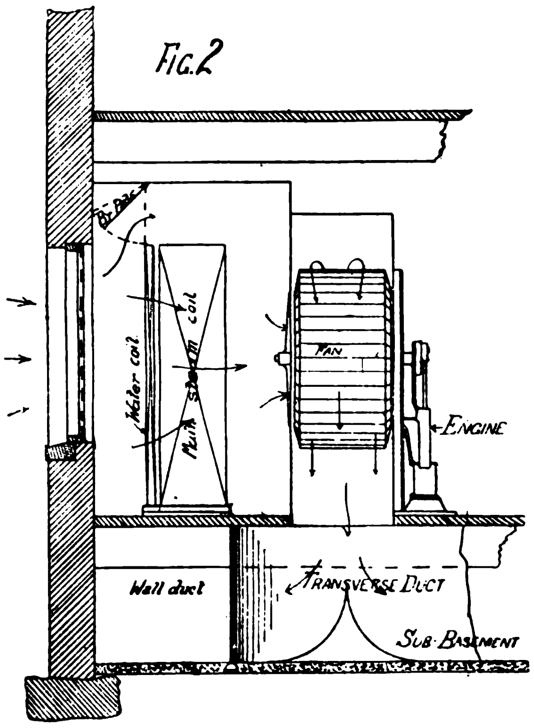
The above is a paper read before the Illinois Society of Engineers and Surveyors, in January, 1890. In it, the author, after touching upon the varied duties and responsibilities which devolve, or should devolve, upon the municipal engineer, whose services, as he states, are often much too little appreciated, especially in cities of moderate size, discusses some of the principal questions to which he has to give his attention, especially those of paving and sewerage. Mr. Clark's opinion, given in this paper, that a single ring of brick is ample for all sewers up to a diameter of five or six feet, and that in deep excavations it might be used for a very much larger diameter with perfect safety, is one that would not meet the general approval of skilled engineers.

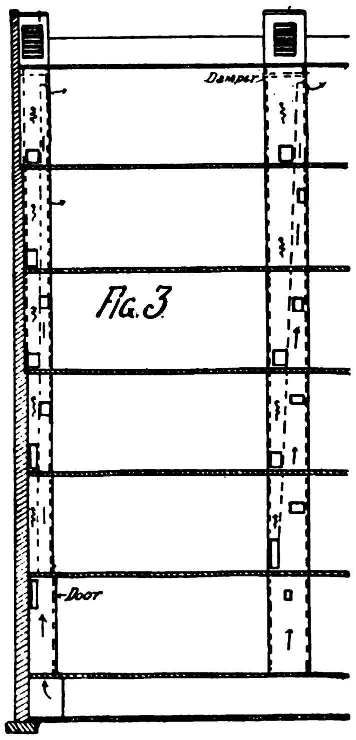
DOMESTIC PLUMBING HEATING LIGHTING & VENTILATION ENGINEERING

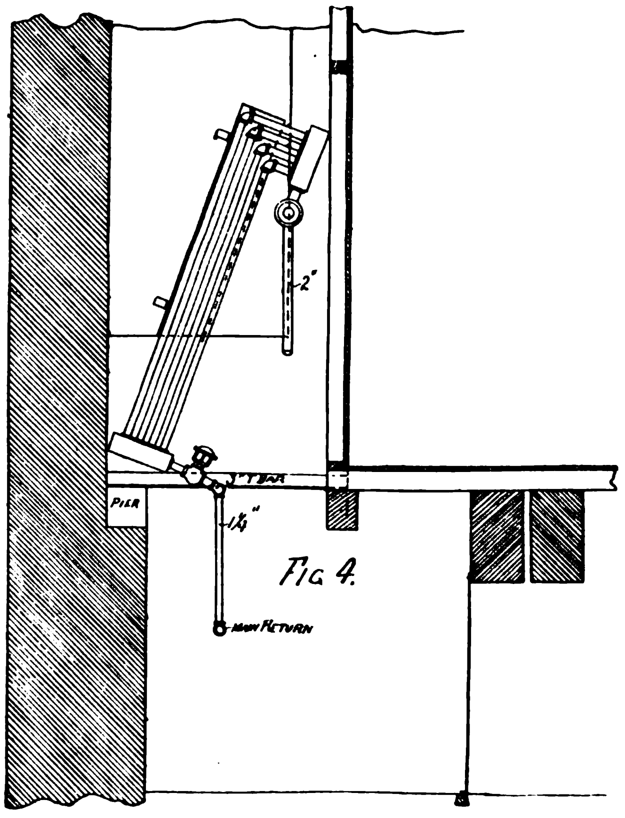
HEATING AND VENTILATING IN THE ENGINEERING BUILDING OF THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

THE system of heating and ventilating in the engineering building of the Massachusetts Institute of Technology, at Boston, was designed by Professor S. H. Woodbridge, and to him we are indebted for the following particulars and annexed illustrations relating to it.









STEAM HEATING AT THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY, BOSTON.

The building is without interior walls other than light partitions, and all available external wall space is demanded for piers and windows. Locations were allowed for eight vertical flues, varying from 9 to 12 square feet in cross-section, for the supply and discharge ventilation of the thirty and more rooms. The rooms were arranged by their intended users, with only partial reference to the fixed location of flues, and connecting air ducts were disapproved as unsightly. The great value of the basement floor space imposed a limit of 16x12 feet on the area to be surrendered to ventilating purposes. The use of the concrete floor of the sub-basement for apparatus, above and about which the basement floor is removed, precluded the use of this space as a distributing air chamber, and compelled the building of a continuous duct about the perimeter of the sub-basement, Fig. 1, with one cross duct beneath the fan at A A, and into which it discharges The main duct, except where engine beds B encroach upon it, is 15 square feet in cross-section. The cross duct has nearly twice that area. The control of the air quantities to be moved in one direction or another within these ducts is effected by movable deflectors, one under the fan, and one at each end of the cross duct.

The perimeter ducts have for three of their sides the foundation wall of the building, the sub-basement concrete floor, and the wooden floor of the basement. The fourth side is of galvanized iron, secured by nailing to wooden strips set in the concrete and nailed to the wooden floor and beams. A free use of elastic cement was made in all joints between metal and wood, and of paint in all locked or other joints of the sheet metal, and provision made for a possible settling away of the concrete from the wooden floor.

To clear the laboratory ceiling and the floor space of all possible obstructions and the unsightly appearance of piping, the steam mains and branches, traps, etc., are placed within the air conduits. All such steam pipes are carefully pitched and drained and covered.

In the plan of the sub-basement floor, Fig. 1, these pipes have not been shown, since the small scale of the drawing might have tended to create some confusion.

The eight vertical ducts F (see also Fig. 3, which is an elevation of the ducts), are of necessity made to serve the dual purpose of supply and discharge. To adapt them to such purpose, a diaphragm is fixed in such way as to provide two channels having areas proportioned to the quantities of fresh and spent air to be moved through them to and from the successive stories. These diaphragms are made of sheet iron, which is secured by methods effectually preventing the leakage of air from the plenum into the exhaust conduits. Wherever practicable, the diaphragm is so placed as to remove the supply conduit from the outer walls, and to bring the discharge conduit against them.

Because of the small space occupied by the entire system, velocities of the air moved must be high. To secure to each register of the lower stories its proportion of air, and to prevent its going by such register under the momentum of its movement, deflectors are used, the area of each and the angle at which it is set controlling the air volume issuing from each register. Similar deflectors, set in a reverse position, are used for the outlets from the upper stories. To thoroughly break up and diffuse the swift flow of cool air in solid current from the register, diffusers, such as are shown in Fig. 1, are used.

The building accommodates some 30 students, and the air supply is nearly 2,000,000 cubic feet per hour, the fan running at 250 revolutions.

The warming is effected by three systems. Because of the great amount of steam work done in the basement, air must be supplied in large quantities, and at a temperature ranging from 45 to 55 degrees, according to laboratory work and outside conditions of weather. The eight distributing flues cannot supply air to the several floors or rooms at different temperatures. They must supply it at the temperature required by that room above the basement most easily warmed to the point desired. Therefore it becomes necessary to provide means for supplying air through one system of conduits to the basement at, say 50 degrees, and to all rooms above the basement at 70 degrees, and to further warm the air by direct means, in such rooms as require supplementary heat.

The air is heated before it reaches the fan to 50 degrees, a "Standard" metallic thermometer mounted in the fan case indicating the temperature, which is controlled by regulating the steam pressure in the coil. In moving under pressure through the sub-basement conduits the air leaks into the basement, as was anticipated, through innumerable small vents, the current being nowhere sensible, and yet the aggregate volume amounting to some 750,000 cubic feet per hour. Reaching the base of the flues the air passes through steam coils so made and placed that the flue area is not obstructed (Fig. 4). The control of steam to these coils is by means of the Johnson electric regulating apparatus, the thermostat being hung before the supply register on the third floor. Whatever the temperature in the sub-basement conduits, the air supply to the rooms may be maintained at 70 degrees or 72 degrees, the range being confined within these limits by the automatic action of the regulator.

Within the rooms are placed wall steam pipes, the steam supply to which is regulated by the Johnson automatic apparatus, the thermostat being exposed within the rooms. For the quick warming of the building the sub-basement conduit temperature may be run up to 100 degrees, and the flue thermostat may be swung away from the register front. Air at such times may be circulated through the building instead of being taken from the outside.

The construction and arrangement of the auxiliary heater at the base of the flues is a matter of interest, because well suited to a successful working of the automatic method of steam supply. The steam enters at the top and through a valve so throttled that when the main conduit air is at its coldest the steam flow will be nearly continuous. The coil drains through a check valve. Without such arrangement, Professor Woodbridge explains, the temperature within the flue would fluctuate through a considerable range, for on the wide opening of the supply and return valves steam would enter freely at both ends and suddenly heat up the coil and the flue. It is desirable that the steam flow should be as nearly continuous as possible, and sufficient in quantity to warm the air passing through the coil. If the supply valve is throttled the drip valve must be closed until the pressure within the coil is sufficient to force the accumulated water outward against the steam pressure. A throttled drip valve would allow steam to back into the coil and cause pounding. But the check valve holds back the steam and allows the condensation to collect until its weight and the steam pressure combined force the valve open and the water out. The filling of the pipes with condensed water serves also the useful purpose of automatically regulating the length of their heated parts, and aids in maintaining the even temperature sought in the flues.

The heating is for the most part done by the exhaust steam of engines and pumps used in the building, and to avoid the possibility of returning oily water to the boiler the condensation is passed into the sewer. For the purpose of cooling this water, and of utilizing its heat, it is passed through 800 feet of continuous 1¼-inch pipe, made into a trombone coil 38 pipes high, 7 feet long, and 3 pipes deep, placed before the inlet window. In mild weather the condensation is so small that it goes to the sewer cold. When the outside temperature is low the temperature of the chilled water is higher, the increase in the rate of condensation slightly exceeding that of the chilling. The maximum rate of flow is about one cubic foot per minute.

The fan and combined heater, Fig. 2, with directly attached engine, is of the Sturtevant pattern and make, with a large by-pass over the heater. The fan is 6 feet in diameter, and at 250 revolutions per minute supplies 33,000 cubic feet of air.

The water of condensation is taken care of by a syphon trap made of a 4-inch pipe, 18 feet long, driven vertically into the ground, bushed at the top and tapped at the side. Through the bushing runs a 2½-inch pipe to within one foot of the bottom of the large pipe. This pipe is bushed at the top, tapped at the side and open at the bottom. The tap receives the water from the returns. The bushing receives a 1-inch pipe which drains the supply main at a higher pressure than the return, and runs inside the 2½-inch to within one foot of the bottom of the large pipe. Within the trap there may, therefore, be two pressures and two heights of water columns on the steam side, one vent discharging the water of both. The only resistance or friction is that due to the flow of water through the large pipes.

All steam for the building is brought from the Rogers building through an underground 6-inch pipe, about 1,000 feet long. The water condensed in the heating apparatus is metered, and the record preserved for the purpose of record and investigation.

The cost of the complete installment was nearly as follows:

Fan, engine, main coil (1,000 square feet), coolers, etc... ..	$1,445
4,580 square feet of direct steam surface, flue coils, mains, fittings, and placing...	4,490
Construction of ducts and sheet iron work................ ..	900
Johnson's electric service.	1,355
Pump, Locke's regulators, sunken syphon trap, covering mains, etc.....	1,775
Total....	$9,965

The direct heating surface is as great as though the heating of the building depended solely upon it, as insufficient boiler power threatened to make the use of the ventilating system impracticable in severe weather. Furthermore, if air is passed into the rooms at the temperature at which it is desired to keep such rooms, to maintain that temperature the direct surface must be as large as would be required for heating by direct radiation.

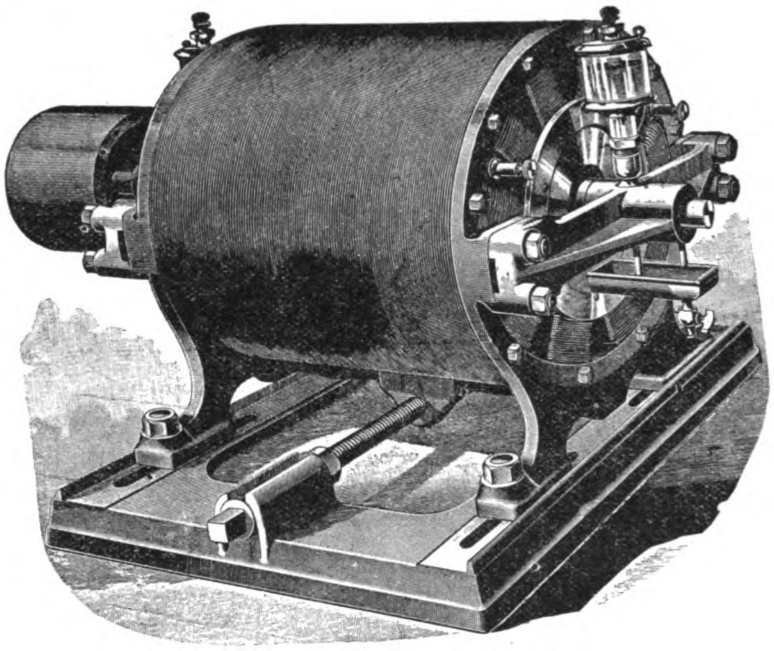


FIG. 32.—THE WESTINGHOUSE MOTOR.

The system is practically a dual one, the capacity of either part being enough for the heating of the building. The ventilating system includes the main heater, cooler, fan, engine, duct, supplementary heater in flues, etc. Its cost may be put at $3,500, and the balance may be charged to the heating plant. The total heating surface is about 1 square foot to 110 cubic foot of space.

Handicapped by the conditions imposed, the work is of interest not so much as an illustration of a perfect system, as of what may be accomplished under difficulties.

The following summary will prove of interest:

Area of inlet windows	33	square feet.
Area through steam coil..	20	"
Area of fan mouth	13.3	"
Area of fan discharge...	12.2	"
Area of floor occupied by fan room and heating chamber..	120	"
Area of heating coil....	1,200	"
Area of flues for supply and discharge of air	96	"
Number of flues for supply and discharge of air.	8	"
Air volume supplied, cubic feet per hour	1,950,000	

ELECTRIC MOTORS.

(Continued from page 397.)

THE WESTINGHOUSE MOTOR.

THE Westinghouse motor, shown in Fig. 32, is an alternating current motor, and is made by the Westinghouse Electric Company, of Pittsburg, Pa.

This motor, like the alternating current dynamo, dispenses with a commutator and, moreover, has no electrical connections of any kind with the armature, relying solely on induction for the rotative effort. The motor consists of a series of field magnets, wound with two sets of coils, the ends of which are connected to binding posts conveniently located for attachment to the supply circuit. These binding posts form the only connection with the current, the latter being taken from the regular lighting circuits, with the addition of a single return wire. This return wire makes it possible to send two alternating currents through the field of the motor at the same time, the pulsations of the currents being similar but not simultaneous. The resultant of these two currents is that a rapidly rotating polarity is given to the field, corresponding in period to that of the currents producing it.

The armature is similar in construction and appearance to the ordinary Siemens drum armature, without the commutator. The winding is, however, claimed to be simpler, and consists of a few turns of comparatively small wire, the ends of which, instead of being carried out to a collecting ring, or any other form of sliding contact, are soldered together, forming a closed circuit having no connection with the main current. The alternating currents in the field induce secondary currents in the armature, and by the attraction between these and the revolving polarity of the field, rotation is produced, the rate of rotation corresponding very nearly with that of the field. The field of revolving polarity must not be confounded with any actual revolutions of the field magnets. The field magnet considered as a structural part of the motor is fixed, but the magnetic axes of its polarity rapidly shift their position.

When no work is being done by the motor, very little current passes either through the armature or field; but as load is put on and the work increases, the armature tends to lag slightly, causing the passage of more current in proportion to the work done. The reaction between the armature and the field is similar to that between the primary and secondary coils of a Westinghouse converter, and the increase of load on the motor causes increased supply of current in a manner similar to that when lamps are added to the secondary circuit of a converter.

By an ingenious adaptation of the converter principle, the motor may be regulated in speed and the direction of motion reversed without the use of switches and resistance coils. The method of operation is exactly similar to the link-reversing gear of a locomotive. The extreme position of the reversing lever in one direction corresponds to full speed ahead. From this it can be graduated through every intermediate speed to the reversing point, and from that on to full speed backwards.

Lightness and compactness are claimed for the motor. It can be served either through a converter or directly from the primary circuits.

(TO BE CONTINUED.)

ONE of the latest practical applications of aluminium is found in electric street car trolleys. The great lightness of such aluminium trolleys constitutes an important advantage in overcoming the mechanical difficulties of current collecting.

THE METHOD OF PROPORTIONING RADIATING SURFACES.

BY R. C. CARPENTER, ITHACA, N. Y.

THE method of proportioning radiating surfaces in common use is a rule-of-thumb, founded perhaps on experience, but, at the very best, an unscientific operation, which often proves very unsatisfactory.

It is usually the custom to make the radiating surface some portion of the cubic contents of the room, say 1 to 40 for hot-water heating, and 1 to 60 for steam heating, with various modifications, reductions or additions as the case may require, and as the judgment or experience of the designer indicates. If the changes from this proportion are managed with good judgment the radiating surfaces will be well distributed, otherwise some rooms are likely to be cold and others too hot. What may seem strange, the first writer on the subject of steam heating seems to have been the principal one to investigate this subject from a scientific standpoint, and his rules, although somewhat complex in their application, can be, I believe, adapted to our practice of to-day. The writer I refer to is Thomas Tredgold, and his work was written more than sixty years ago. The works of Hood, following twenty years later, make use of his experiments and rules and put them in better form for practical use. I think the methods of reasoning and the researches of Tredgold are worth the attention of all those engaged in designing heating apparatus, and as the book may not be accessible to many, I will briefly refer to them, as well as to Hood, and also give some reductions from his results, so as to make them applicable to modern practice.

In the first place, he refers to a well known fact, that a higher temperature is required in a room heated by conduction, or by conveying in bodies of heated air, than in the case of a room warmed by radiant heat chiefly, for the reason that in the first case the air of the room is abnormally dry, and evaporation takes place from the body, which produces the sensation of chilliness; in the latter case no such an effect is experienced.

Radiant heat, however, acts to warm a person very unequally, so that one might literally burn on one side and freeze on the other; yet despite the inequality caused by such heating, it is, in connection with a limited amount of heating by conduction, the most satisfactory method. For conveying heat he argues that steam is the best medium, and, he thinks, superior to hot water, though judging from the erroneous causes that are given for hot-water circulation, he seems to have known little or nothing of hot-water heating. Believing it to be very injurious to health to heat air with any surface hotter than 210 degrees, he rejects, as unsatisfactory, other methods, and considers simply steam heating. It will surprise many modern heating engineers to see how perfect was the apparatus in nearly every detail even in his time.

As for his scientific calculations, he takes as his unit the heat necessary to raise the temperature of one cubic foot of water one degree per minute. We ordinarily take as a unit the heat necessary to raise one pound of water one degree per hour, which we denote as a British Thermal Unit, or in symbols B. T. U.

The unit used by Tredgold is 3674.4 times as great. He finds from calculation that the same heat that would heat one cubic foot of water one degree would heat one cubic foot of air 2,850 degrees, or this heat would warm 2,850 cubic feet of air one degree.[*] That is, according to Tredgold, a cubic foot of air would require .00035 as much heat as a cubic foot of water; and he further states that a cubic foot of iron would require .95 as much as the same bulk of water.[†]

Tredgold next undertook to ascertain how much heat was given off from different kinds of surfaces, and I consider his experiments of this kind the best that have been made. In making these experiments he allowed for the specific heat of the metals employed, but did not allow for the thickness, and in this respect the later experiments of Peclét would indicate that he had made no appreciable error. The method employed was to fill pipes of different material with water at 180 degrees and note the time it took to cool to 150 degrees, and he made corrections for heat transmissions in accordance with the method of Dulong and Petit; his methods are to be considered accurate, although errors of measurement may have been made.

The results obtained were as follows, the last column being deduced by the writer:

	Proportional conduction and radiation of heat.	Tredgold's unit as explained, per minute.	B. T. U. per sq. foot per hour, deduced from Tredgold's values.
Tinned iron.	100	.00041	1.46
Glass	155	.000644	2.37
Glass, later trial	.. .	... ...	1.99
New sheet iron with smooth black-scale	156	.000656	2.47
Sheet iron, rusty and brown surface.	180	.000738	2 70

The last was assumed to be like cast-iron. Tredgold, at a later date, measured the cooling of water contained in a cast-iron pipe. This can be reduced to the following:

	Proportional conduction.	B. T. U. per sq. ft. per hour
Cast-iron pipe, ordinary rusty surface	128	1.88
Same pipe covered with black varnish	132	1 93
Same pipe covered with white paint	125	1.83
Glass, later trial	....	1.72

It is interesting to compare this test with one made by Mr. George H. Barrus with a cast-iron and a wrought iron radiator in a similar manner. The cast-iron radiator gave 1.72 B. T. U. per hour per foot of surface, while the wrought-iron radiator, under the same conditions, gave off 2.04 B. T. U.

Tredgold next found that the product of the number .000738, which he took as the heat units given off from a cubic foot of water per minute, through cast-iron pipe, multiplied by 2850, the number of cubic feet of air heated by the cooling of 1 cubic foot of water one degree, to be 2.1. This, multiplied by the difference of temperature between the pipe and the air, would be the cubic feet of air heated by one square foot of pipe per minute. The number taken from Barrus determination should be 1.6 instead of 2.1 or about 25 per cent. less) Tregold's rule to find the radiating surface is: Multiply the cubic feet of air to be heated per minute by the difference between the temperature the room is to be kept at, and that of the external air, in degrees, and divide the product by 2.1 times the difference between the temperature of the pipe and that of the room. Example: How much steam-pipe surface is needed to heat a room 70°, when outside air is 0°, and 500 cubic feet of air are needed per minute? We have $500 \times 70 = 35000$ divided by $(2.1 \times (212 - 70) = 298.2,)$ which gives as a result, 116.8 square feet.

The methods used to find the number of cubic feet of air needed per minute, which is indeed the most difficult part of the required computation, were as follows: From the experiment which has already been described, he found that a square foot of glass would cool 1½ cubic feet of air 1° per minute for every degree of difference of temperature. He also made some experiments relating to the cooling effect of ordinary doors or windows, from which he concluded that each door or window, in addition to the glass let in 11 cubic feet of air per minute which had to be warmed to the temperature of the room. For ventilation he adopted the low co-efficient of 4 cubic feet per minute for each person in the room. Hence, he had the following rule for air to be warmed per minute:

RULE.—The amount of air to be warmed per minute should be equivalent to 4 times the number of people the room is to contain, added to 11 times the sum of the windows and doors, added to 1½ times the number of square feet of glass.

By combining the two rules we readily find the radiating surface required in any room to be equal to the difference of temperature between the outside air and that in the room multiplied by the sum of 4 times the people, plus 11 times the windows and doors, plus 1½ the area of the glass, divided by twice (the difference between the temperature of the steam pipe and that of the room). This, expressed algebraically, is as follows: Let S equal the radiating surface required; let P equal the number of people expected to be in the room; W, the number of windows and doors together; G, the area of glass surface; t, the required temperature of the room; t', the outside temperature; T, the temperature of the pipes.

$$\text{Then } S = \frac{(t - t')\,(4\,P + 11\,W + 1.5\,G)}{2.1\,(T - t)}$$

Example: In a room 20x14 feet and 11 feet high, having three windows each, with 20 square feet of glass, and one door, required the radiating surface to keep it at 70 degrees when the outside air is zero. Allowing 300 cubic feet to each person, such a room would accommodate 10 persons, although for private houses the allowance must ordinarily be double this. For hot water heating take T equal 170 degrees. Then

$$S = \frac{(70)\,(40 + 44 + 90)}{2.1\,(100)} = 58 \text{ nearly.}$$

Since there are 3,080 cubic feet of air in the room, this will give one foot of radiating surface to each 53 cubic feet in the room.

A corner room, or exposed room, of that size, would generally have five windows, in which case, the other dimensions remaining the same,

$$S = \frac{70\,(40 + 55 + 150)}{210} = 82 \text{ sq. feet, or 1 to 38 cubic ft.}$$

These dimensions are evidently small compared with our modern practice. If we introduce in place of 2.1 the co-efficient 1.6 obtained by Mr. Barrus from an actual test of a cast-iron radiator, we have:

$$S = \frac{(t - t')\,(4\,P + 11\,W + 1.5\,G),}{1.6\,(T - t)}$$

which is equal, for the first case cited, to 77 square feet, or about 1 to 45 cubic feet, and in the second case, with five windows, 100 square feet is required, which is equal to about 1 to 30 cubic feet of space. In this latter case the rule agrees very well with modern practice.

The work of Charles Hood on hot water heating was written about 20 years later, and by following the same course of reasoning as Tredgold, but using somewhat different co efficients, he arrived at the following formula: Letting l = required length of 4-inch pipe, the other letters remaining as before explained, he gives:

$$l = \frac{125}{222}\,\frac{(t - t')\,(5\,P + 1.25\,G)}{(T - t)}$$

Since .849 foot of 4-inch pipe makes one square foot of surface, the number of square feet of heating surface becomes by reduction

$$S = \frac{(t - t')}{1.507}\,\frac{(5\,P + 1.25\,G)}{T - t} = .6644\,\frac{(t - t')\,(5\,P + 1.25\,G)}{T - t}$$

Applying this to the first example, we have

$$S = .6644\left(\frac{70'}{100}\right)(50 + 75) = 59 \text{ sq. feet,}$$

an amount almost identical with that given by Tredgold's rule. In the example regarding the corner room, we have:

$$S = .6644\left(\frac{70}{100}\right)(50 + 125) = 82 \text{ square feet,}$$

an amount 5 per cent. in excess of that given by Tredgold's rule.

Various other rules have been proposed from time to time. Nason, in his catalogue, states Hood's rule as follows:

$$\frac{S = 147\,(t - t')\left[1.289\left(G + \frac{O}{20}\right) + 5\,P\right],}{250 \quad T - t}$$

in which O = the area of outside wall; P = the number of people; G = the area of glass; T = the temperature of the heating medium; t = the temperature of the room; t' = the temperature of the outside air. This formula differs from the one previously given by the introduction of one-twentieth of the exposed wall surface, for which there is no good reason. If introduced it should not exceed 1 per cent. instead of 5, and, except in peculiar conditions of buildings, it will rarely be as much. Consequently there seems to be no advantage in introducing it, as it makes the problem unnecessarily complex.

(TO BE CONCLUDED.)

THE Secretary of War has appointed a commission, authorized by Congress, to examine the Sacramento and Feather Rivers, California, to ascertain what is needed for their improvement, and report fully to the War Department for the information of Congress. The Commission consists of Col. G. H. Mendell, President of the Board; Major Alexander McKenzie and Captain Dan C. Kingman, United States Army Corps of Engineers.

---

[*] Modern determinations would make this somewhat more, since the modern determination of specific heat of air is less than Tredgold used. The heat required to heat one cubic foot of water one degree would heat $\frac{62.5 \times 12.5}{.238} = 3324$ cubic feet of air one degree.

[†] A pound of air is heated 1° by .238 B. T. U; a cubic foot of air is heated 1° by .0192 B. T. U.; or 1 B. T. U. will heat 52.8 cubic feet of air 1° in temperature by modern determinations.

Notes and Queries

on Domestic Engineering.

Communications relating to the practical details of plumbing, heating, lighting and ventilation will be welcomed in this column. The writer's true name and address must always be given, but an assumed name may be used for publication if preferred.

RETURN PIPES IN A GRAVITY RETURN STEAM HEATING SYSTEM.

"SUBSCRIBER," of Weymouth Center, Mass., writes: "I should like to inquire through the columns of your paper in regard to piping for the return of a steam heating apparatus.

"The question is this: Would it be better to have the return pipes from the radiator drop perpendicular to a point below the water line in the boiler, and then run back to the boiler, keeping below that point, or would it be better to have the return pipe drop perpendicular, say one foot below the lowest point in the flow pipe, and then return to the boiler with a good grade down? Would there be any practical difference?"

[It is in all cases better, with the gravity return apparatus, to drop the return pipes perpendicularly below the water line at once, and then follow a perfectly aligned down grade to the boiler. The amount of pitch in the grade is not at all essential. When once you are below the water line the angle of the pitch has nothing to do with the flow of the water towards the boiler. The pitch should be great enough, however, to overcome any inequalities in the straightness of the pipe. Return pipes below the water line that are dead level will answer if no air becomes trapped within them. The slight pitch required above is, therefore, only necessary to insure the separation of the air to prevent "air-binding" in the return pipe. An air trap in the return pipe will offer a resistance sufficiently great to prevent a proper return of the condensed water

A horizontal return pipe must be either *sufficiently* above the water line to insure its never remaining filled with water, or it must be *below* it. The horizontal return pipe that is just at the water line or a little above it, so that fluctuations of pressure in the steam allow the water within the pipe to rise and fall a little, so that at one time it is dry and in a few moments after full of water, is always sure to be noisy. When it is necessary to run part of the return pipes above the water line, as in the wing of a building where there is no cellar, it should be run as high as possible and then dropped suddenly in a perpendicular manner within the deep cellar. In half excavated cellars it is a common thing to follow the ground line for convenience in supporting the return pipe. Should the grade of this half excavated cellar be a little above the water line of the boiler noise is sure to follow for the reasons given before. Should you begin to drop your return pipe from the lowest point of the flow pipe, as you suggest, you will be very apt to find noise where your return pipe crosses the level of the water line of the boiler. We presume that the above presents all the ordinary aspects of the question.]

Questions and Answers.

All questions relating to building construction, paving, sewerage, water supply, or kindred subjects, will be welcomed in this column provided they relate to matters of general interest and are not such as should properly be referred to a consulting engineer. Answers will be carefully prepared and a proof of both question and answer mailed to the inquirer as early as proper consideration will permit. They will be published for the benefit of other readers as soon as convenient. The full name and address should be given, not necessarily for publication, but as a guarantee of good faith, and to facilitate further correspondence in case the question is not sufficiently explicit.

Inquiries of the Editor, in order to secure prompt attention, should *not be written on the same piece of paper as a communication* to the *Publishing Department*. Letters renewing subscriptions are sent to a clerk in the publishing office, and matter for the Editor, if in the same enclosure, is likely to be overlooked unless it is on a separate piece of paper, so that it may be promptly sent to the Editor.

CORROSION OF IRON FLOOR BEAMS FROM CINDER FILLING.

"ARCHITECTS," New York, write: "In the article on 'Cast *vs.* Wrought Iron for Gas Mains,' published in THE ENGINEERING RECORD of September 6, quoted from a paper by Mr. Eugene Printy, cases are noted of serious corrosion of iron pipes, especially of wrought iron, produced by laying them in cinders obtained from locomotive ash pits.

"It is customary to use coarse cinders for filling in over the brick arches between wrought-iron beams for carrying granelithic side walks, and also for filling in over the arches between the floor beams in warehouses. In the case of sidewalks we fill the cinders in loosely, and in the case of interior floor beams we mix the cinders with cement mortar sufficient to make a coherent mass.

"Considering the statements made in Mr. Printy's paper, we would be glad to learn if you think the contact of the cinders with the iron floor beams would be sufficient to seriously injure the beams and eventually render them unsafe; and if you would advise substituting other filling for the cinders."

[There is certainly much danger in placing any iron, especially wrought iron, in contact with cinders if there be any moisture present. The injurious action of the cinders upon iron seems to arise from the formation of sulphuric acid from the sulphur contained in the former. As the percentage of sulphur varies greatly in different kinds of coal the action of some cinders would doubtless be slight.

Mr. Charles B. Brush says (*Transactions American Society of Civil Engineers*, Vol. 19, page 118): "I have had considerable experience with small wrought-iron pipe buried in the ground, and it has been unsatisfactory. There is great lack of uniformity in its durability. Ashes, especially, will soon destroy wrought-iron pipe, often during the first year"

A singular instance is given (in the *Journal of the Association of Engineering Societies*, Vol. 4, p. 274), of the corrosion of a 6-inch cast-iron water main at Fall River, by Mr. Philip D. Borden, Jr. The pipes, which were from two or three different makers, and had been in about nine years, were so corroded as to lose, in places, one-half to three-quarters of their substance, the thickness being reduced even to one eighth of an inch. These pipes were laid in a filling of cinders, iron slag from puddling furnaces, and other refuse from iron works, and the salt tidal water from the adjoining bay penetrated to and immersed the pipes twice in 24 hours. It would seem as if here were all the elements to account for the corrosion without looking farther for it. A chemical study of the case was, however, made by Prof. William Ripley Nichols, and he had been unable, up to the time the paper was published, to repeat the corrosive effects by experiment, or to produce acid reaction in the salt water kept in contact with finely powdered cinder. Moreover, other neighboring pipes laid in the same material were unaffected. The cause of the corrosion did not seem to have been definitely settled.

While, therefore, there might be no serious corrosion of iron beams from contact with cinders in cases such as that referred to in the above query, especially if there was any certainty of their remaining dry, yet, considering the damage to life and property which would arise from the failure of a heavily loaded warehouse floor, it would be safer to use some other material for filling, or to thoroughly plaster the beams with a coat of cement mortar so as to prevent any contact with the cinders.

We should be glad to hear from any of our readers who may have had experience on the subject of the query, as it is a matter of considerable importance.]

ACCORDING to a Hazleton, Pa., account, the Jeddo Tunnel Company will, about February 1, begin to drive a tunnel 4½ miles in length (starting at the foot of the Jeddo slope and extending to Butler Valley), for the purpose of draining the Jeddo, Harleigh and Ebervale Mines into the Susquehanna River at Berwick. In June, 1885, 30 acres over the Harleigh Mine caved in, causing a big creek to flow into the mines, but after a month's hard work the water was pumped out and work again resumed, only to be stopped a year later by the heaviest rain storm of the season, that flooded that mine and Ebervale. After months of vain endeavor to pump both mines dry they were abandoned, and the miners sought employment elsewhere. The tunnel will drain both mines.

AT the Chamber of Commerce in Albany, on Thursday, December 11, the special commission appointed in accordance with the provisions of the River and Harbor Bill will give a hearing on the subject of improving the channel of the upper Hudson so as to permit the passage of large vessels to Albany and Troy. Two propositions will be before the Commission. One is to make a ship channel to Albany only, and the other to extend it to the State dam.

THE large water-works tunnel under the lake at Cleveland, O., was completed on the 17th inst. The tunnel is 7 009 feet long, and eight feet high, with three courses of brick. It required 8,000,000 bricks to complete the lining. The wall is 12½ inches thick.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

THE ENGINEERING AND BUILDING RECORD,
277 Pearl Street, New York.
November 29, 1890.

ARCHITECTURAL COMPETITION.

Grand Rapids, Mich.—The local Board of Police and Fire Commissioners has invited architects doing business here, to submit designs, to suit a plan which they have already adopted, for a building to contain a police station and all the necessary offices of the Boards. They ask for two designs, one to cost $30,000 and the other to cost $40,000, each building to be two stories high, with good basement and high attic. Designs are to be sumbitted before December 13.

CONTRACTING INTELLIGENCE

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." *Information of importance sent to us exclusively, and not elsewhere published will be liberally paid for.*

For works for which proposals are requested see also the "Proposal Columns," pages i-ii-xi

WATER.

For Additional Water Items see Proposal Columns.

Seattle, Wash.—Reports say that the Trustees have purchased the Springhill Water-Works plant, and will make extensive improvements at once.

Wheatland, Iowa.—The project to improve water supply at this place is now a certainty.

Austin, Tex.—The Uvalde Water Supply and Power Co. has been incorporated. Capital stock, $25,000.

Topeka, Kan.—The following bids for a water-works system for the G. A. R. Reunion grounds at Ellsworth, Kan., were received by H. M. Hadley, architect, Nov. 15: A. A. Arment & Co., Dodge City, Kan., without the well, $3,478.80; E. W. Abendorph, Kansas City, Mo., without the well, $4,000; Thomas and W. C. Brown, Ellsworth, Kan., including well, $4,445; Christian States, Topeka, Kan., including well, $4,350; A. L. Snyder & Co., Topeka, Kan., including well, $3,985; Lawrence Plumbing and Heating Co., Lawrence, Kan., including well, $3,724.

Kettle Falls, Wash.—A. D. Burns editor of the Kettle Falls *Pioneer*, writes: "Kettle Falls is an entirely new town and not incorporated, but is backed up by a syndicate of Rochester, N. Y., gentlemen. $15,000 will be spent at once for water-works, water mains, etc. A $15,000 hotel is being built, which will be furnished with water throughout, as well as modern conveniences. The supply will be from a fine spring."

Halifax, N. S.—The City Council has decided to engage an hydraulic engineer to make an examination of the water-works system, with a view of making such improvements as may be necessary. Address Alderman Lyons for particulars.

Madrid, Neb.—The Madrid Water and Improvement Company has been incorporated for the sinking of artesian wells and making such other internal improvements as may be desired. The capital stock is $5,000, and the incorporators are D. D. Dayton, N. T. Potter and others.

Milledgeville, Ga.—City Clerk G. W. Coraker writes: "The question of increase of taxation for water-works will be submitted to the voters of our city on December 9. Should the vote be for the increase, the contract, as I understand it, is awarded already to Wm. Wheler, of Concord, and Chas. F. Porks, of Waltham, in the Commonwealth of Massachusetts, and John H Yeaton, of Palatka, Fla. From my understandings of the action of our City Council, it shuts out all other competitors, which, in my judgment, is wrong."

Columbus, Mo.—Bonds have been voted at this place for the purpose of introducing a system of water-works. Address the Town Clerk for particulars.

Orange City, Iowa.—The people of this place have voted in favor of water-works.

Chambersburg, Pa.—The following proposals for the construction of a 2,000,000 gallon reservoir, and to furnish, lay and connect about 9,000 feet of cast-iron pipe, were opened November 20, by D. B. Kirby, Town Clerk: A. H. Coon, Kingston, Pa., reservoir and pipe line complete, $20,800; James H. Harlow, Pittsburg, Pa., same as above, $21,230, with extra allowance for rock exceeding 20 cubic yards; Jehiel Vaughn, Middletown, N. Y., reservoir alone, $9,255, estimated from prices and quantities; laying pipe, 12-inch, 45 cents; 10-inch, 40 cents; 8-inch, 38 cents. James S. Reside, Chambersburg, Pa., pipe line complete, 12 A, $1.69; 12 B, $1.62; 10 A, $1.29; 10 B, $1.25; 8', $1.15. Seven bids for pipe were received, ranging from $27.15 to $29 05 per gross ton, the former figures being only for a portion of the pipe wanted. Special castings were offered by four firms from 2¼ to 2⅝ cents per pound. Contract awarded A. H. Coon, of Kingston, for the entire work complete, at $20,800.

Sioux City, Ia.—The City Council has accepted the proposition of Godfrey Brothers, of Fremont, Neb., to put in a system of drive wells and pumping apparatus to help out the water supply for the city until a big plant, drawing its supply from the Missouri, can be built. The contract price of the temporary plant is $35,000.

Pine Grove, Pa.—The Pine Grove Water Company has been organized to establish a plant at this place. Capital stock, $40,000. Address Jacob Ulmer for details.

Burlington, Wis.—This village decided, November 25, in favor of bonding itself for $8,000 to put in 2½ miles more of water mains and build an additional reservoir at the pumping station. The work will be let during the winter and commenced as soon as the weather permits in the spring.

Canton, S. D.—At a special election held here, November 25, it was decided to bond the place for water-works.

Water-Works.—See our Proposal Columns for information regarding water-works and water-works furnishings at the following places: Lowell, Mass.; Cincinnati, O.; Belvidere, Ill.; Harrison, O.; Ballinger, Tex.; St. Louis, Mo.

SEWERAGE.

For Additional Sewerage Items see Proposal Columns

Chico, Cal.—Town Clerk J. D. Sproul writes: "The Board of Trustees have had plans, specifications and detail drawings prepared by Messrs. Shepard & Teilman, of Fresno, Cal., and are now negotiating for the right of way, six miles, from the city limits to the dumping ground. The proposed system is practically the Memphis system, conveying the sewage through salt glazed vitrified sewer pipe, of 12, 14 and 16 inches in diameter. The estimates are in round numbers $60,000 for main, and such lateral sewers as it is proposed to put in under the plans. The bond election will be called within the next two months. A two-thirds vote is required under our State constitution to put a bonded indebtedness on a municipal corporation."

Fostoria, O.—The Sewer Commission has about completed its preliminary work, and at a recent meeting adopted plans and specifications prepared by G. D. Hersey. The system as proposed provides for both sewerage and drainage, and will be paid for by the taxpayers in general instead of on the assessment plan. The Council will be asked to provide funds to the amount of $90,000 to carry out the plans. It will be necessary to sell bonds to raise the money, and Council will, it is said, take prompt steps to meet the emergency. The plans provide for the main sewers to be of brick, 44 inches in diameter, with ten miles of laterals.

Brunswick, Ga.—Town Clerk E. A. Nelson writes: "The contract for the sewerage system of Brunswick has been closed with the 'National Sewerage and Sewage Utilization Company,' of New York, to be completed by June 1, 1891."

Puyallup, Wash.—It is probable that the projected sewerage system for this city will be established, at an estimated cost of $27,000. The City Engineer can furnish particulars.

West Oakland, Cal.—The agitation for a better sewerage system continues at this place.

Rockaway, N. Y.—The Board of Sewer Commissioners has determined upon gravitation as a system of sewerage for this village. The work will be pushed forward as speedily as possible during the winter.

Macon, Ga.—The bill providing for the sewerage of this city was presented to the City Council November 25, and referred to the Legislative Committee for action and report. Representative Boifeuillet can furnish particulars.

Sewers.—See our Proposal Columns for information regarding sewer construction at the following places: Toronto, Can.; Victoria, B C.; Mount Vernon, O.

BRIDGES AND IRON STRUCTURES.

For Additional Bridge Items see Proposals Columns.

Richmond, Va.—There is a movement on foot in this city to bridge Broad Street, the cost of which will be about $500,000.

Wallingford, Conn.—The Selectmen have awarded the contract for the new bridge in Zalesville to the Berlin Bridge Co., and to cost $2,479. The bridge is to be 111 feet in length. The cost of excavation and the mason work will foot up from $1,500 to $2,000 more.

Willimansett, Mass.—The following proposals were received by the County Commissioners of Hampden County, Mass., for building the masonry and foundations of a bridge over the Connecticut River at Willimansett, Mass., in accordance with plans and specifications prepared by their engineer, Edward S. Shaw, of Boston. Opened November 19.

Bidders.	Pier Masonry. 1,900 cu. yds.	Abutment Masonry. 1,250 cu. yds.	Wing-wall Masonry. 1,600 cu. yds.	Pier Foundations. 285 cu. yds.	Excavation. 3,000 cu. yds.	Riprap 750 cu. yds.	Total Amount of Bids.
Wright, Lyons & Co., Springfield, Mass.	$13.00	$10.00	$7.00	$27.00	$0.30	$1.50	$58.120
Flynt Building and Construction Co., Palmer, Mass.	13.50	9.50	7.25	28.00	.30	2.00	50.505
John F. Dolan & Co., Elizabeth, N. J.	17 00	11.00	8.50	14.00	.65	5.00	60,340
J. H. Leavitt, Boston, Mass	16.50	15 00	12 00	15.00	1 00	3 00	78,825
Moulton, O'Mahoney & Trumbull, Boston, Mass	19 97	13.70	9.90	25.00	.30	3 00	81 183
William H. Ward, Lowell, Mass	20.00	15.00	9 00	20.00	1.20	3.00	82,700
J. T. Tank, Providence, R. I	21.00	14.00	9.00	40.00	.50	3.00	86,950
George M. Atkins & Co., Palmer, Mass	24 00	18.00	13.00	25.00	1.00	3.00	101,275
G. L. Bosworth & Co., Holyoke, Mass	28 50	21.00	12.35	31.50	.75	7.00	116,637

The contract was awarded to Wright, Lyons & Co.

New York City.—The *Sun*, of November 28, prints the following: A new iron bridge across the river at Gardiner, to accommodate the Togus narrow gauge road, and a narrow gauge road from Augusta to the towns of China, Windsor, Summerville, Palermo, and Liberty, are the latest products on the Kennebec.

East Harrisburg, Pa.—It has been decided to establish either a bridge or tunnel at the railroad crossing at Market Street. Plans for a bridge are already completed, and it is probable that tunnel plans will also be wanted.

South Glasgow, Va.—Reports say that an iron bridge is to be constructed over the James River, at this place, by the South Glasgow Cement and Development Company, at an estimated cost of $400,000.

Marble Falls, Tex.—The following bids for the construction of an iron bridge over the Colorado River, at this place, were received by Louis G. Hester, Civil Engineer, November 18: Bids were made for both deck and through bridges, at 32 foot and 52-foot spans· Wrought Iron Bridge Co., Canton, O., $38,888, $40,750; George E. King, Dallas, Tex., $34,400; Groton Bridge and Manufacturing Co., Groton, N. Y., $34,973, $38,000; Youngstown Bridge Co., Youngstown, O., $33,000, $32,000, $36,640, $32,760; Chicago Bridge and Iron Co., Chicago, Ill., $30,740, $32,590, $31,600; Milwaukee Bridge and Iron Works, Milwaukee, Wis., $32,687, $34,036, $35,556, without piers; Wisconsin Bridge and Iron Works, $38,400, $34,300, $31,400; King Iron Bridge and Manufacturing Co., Cleveland, O., $34,000, $35,000; Variety Iron Works, $40,847, $40,347, $39,118, $38 839; Clinton Bridge Co., $34,665, $32,480; Lane Bridge and Iron Works, Chicago, Ill., $28,500, $36,200, $35,500; Pittsburg Bridge Co., Pittsburg, Pa., $41,275, $38,650; Berlin Iron Bridge Co., East Berlin, Conn., $38,000. Milwaukee, $32,687, accepted.

St. Paul, Minn.—A bridge will be built across Phalen Creek Valley, to cost $100,000.

Meriden, Conn.—It is proposed to erect two iron bridges in this city, at an estimated cost of $14,000. Mayor Page can furnish particulars.

Kansas City, Mo.—The Wyandotte County Bridge and Terminal Railway Company, of which Willard E. Winner is president, will build a new iron bridge over the Missouri River, eight miles above this city, to cost $1,000,000 or more. Frank D. Moore is the Chief Engineer.

Toronto, Can.—Plans are completed for the projected high level bridge over the Don, at King Street, and it is likely that proposals will be advertised for at once. The City Engineer can furnish particulars.

Cincinnati, O.—At a meeting of the County Commissioners and the City Board of Equalization, held November 24, it was resolved that the specifications for the erection of the bridge over the Miami Canal at St. Bernard, on Carthage Pike, be approved, provided the Cincinnati Inclined Plane Railway Company pay one-half the cost of both substructure and superstructure.

Atlanta, Ga.—Plans for the projected new bridge at Forsyth street have been submitted to the special committee, and Col. L. P. Grant and others have been appointed as a committee to confer with the officials of the Central and the Atlanta and West Point and the Western Atlantic railways regarding the share which their roads should pay towards the construction of the structure. The estimated cost is $25,000 or $30,000. Engineer Clayton can furnish particulars.

Milwaukee, Wis.—The project of bridging the Milwaukee River from Van Buren to Holton Streets is being revived, and a petition to the incoming legislature to legalize the steps necessary for its consummation has received the signatures of a number of citizens. The erection of the structure, it is said, will require the construction of viaducts on either side of the river, and it is estimated that the total cost of the enterprise would be $250,000.

Albany, Ga.—Reports say that an iron bridge is to span the Kinchafoonee Creek, about two miles north of this city, to be erected by the Central, of Georgia.

St. Louis, Mo.—It is proposed to replace the wooden bridge at Twelfth Street, this city, with an iron structure, at an estimated cost of $250,000. New bridges are also projected at the King's Highway, and at Ewing Street. Bridge Engineer Gayler can furnish particulars.

Jersey City, N. J.—The Board of Chosen Freeholders has decided, it is reported, to erect an iron bridge over the Mullica River, between Burlington and Atlantic Counties. The estimated cost is said to be $15,000.

Bridges.—See our Proposal Columns for information regarding bridge construction at the following places: Shebovgan, Wis.; Hamilton County, O.; Kansas City, Mo.

NEW DEPOTS.

Kansas City, Mo.—Plans have been made for a new union depot. Willard E. Winner is interested in the enterprise.

Paris, Ky.—Reports say that the Kentucky Midland Railway is to erect a new depot at this place.

Des Moines, Iowa.—Reports say that a new union depot is to be erected in this city, by the Des Moines Union Railway, Wabash, Maple Leaf, Des Moines, and Northwestern roads.

Pekin, Ill.—Extensive shops are to be erected at this place by the Santa Fe Road.

Huntington, W. Va.—Reports say that a new depot is to be erected at this place by the Ohio River Railroad Company.

STREET-WORK AND PAVING.

Kansas City, Mo.—It is proposed to build a boulevard nearly three miles long along the north bluff. The City Engineer is making a survey.

South Bend, Ind.—The officials have authorized the paving of numerous streets of this city.

Toronto, Ont.—Considerable street work is to be done in this city.

Dayton, O.—The City Commissioners have adopted resolutions authorizing the City Engineer to report plans and specifications, with an estimate of cost for paving several streets of the city.

Meriden, Conn.—The sum of $40,000 is to be expended on improving the streets of this city. Mayor Page can furnish particulars.

Macon, Ga.—The Georgia Quincy Granite Company has been awarded the contract to furnish this city with 10,000 Belgian blocks, at $495.

La Crosse, Wis.—The City Council has authorized the paving of numerous streets of this place.

GAS AND ELECTRIC LIGHTING.

Hannibal, Mo.—The citizens of this place will soon be called upon to vote upon the proposition to issue bonds to the amount of $20,000 for the purpose of putting in an incandescent light plant.

Columbus, Mo.—An electric lighting plant is to be established at this place.

Berwick, Pa.—An electric light plant is to be established at this place. The president of the Borough Council can furnish particulars.

Charleston, S. C.—Important improvements and extensions are to be made to the plant of the Charleston Electric Light Company.

Abilene, Tex.—A franchise has just been granted to the Abilene Electric Company, of which Max Elser is at the head. A plant for lighting is to be established at once.

Bristol, R. I.—Improvements are to be made to the plant of the local Electric Light Company.

Muscatine, Iowa.—Extensive improvements are projected by the Gas, Electric Light and Power Company, of this place.

Jersey City, N. J.—The following awards of public lighting were made by the Police Commissioners November 14: For lighting 935 lamps the United Gas Improvement Company will receive $20 per lamp per annum. The contract for 152 lamps in Greenville was awarded to the same company, in conjunction with the Consumers' Gas Company, price, $21 per lamp per annum. The bid of the New York and New Jersey Globe Gas Light Company, running from 1,000 to 1,500 oil lamps, was $1.68 per lamp. For the Bergen and Hudson City sections of the city the bid of the United Gas Improvement Company for the People's Gas Light Company, was $21 for each of 1,411 lamps per year. The contract for arc electric lighting was awarded to the Hudson Electric Light Company, at 23½ cents per light per night, nearly ten cents lower than the bid of the Jersey City Company.

Seattle, Wash.—A committee appointed by the Trustees to investigate the subject of the cost of electricity and gas for street lighting has recommended that bids be solicited for new contracts for all kinds of lights, for a term not exceeding one year. Also, that the city should own and control its own system of lights. The city clerk can furnish particulars.

Jonesboro, Ind.—A system of lighting is to be established at this place, by the Jonesboro Gas and Improvement Company. Estimated outlay, $300,000. Address Arthur L. Conger, for details.

Chicago, Ill.—The McFell Electric Company has been incorporated in this city, with a capital stock of $8,000. J. McFell is at its head.

Greenville, Ill.—The Greenville Electric Light and Power Company has been incorporated here. Capital stock, $10,000. For particulars address C. D. Halles, as above.

Shamokin, Pa.—A company has been organized at this place with the intention of establishing and maintaining an electric lighting plant.

Aledo, Ill.—The public officials of this place have decided to establish an electric light plant at once, The City Clerk can furnish particulars.

Amesbury, Mass.—A new incandescent machine, with a capacity of 500 lights, is to be added to the plant of the local Electric Light Company.

Woonsocket, Mass.—It is proposed to establish an electric light plant at this place.

Seattle, Wash.—The Standard Electric Company has been formed at this place with a capital stock of $25,000.

McKeesport, Pa.—Extensive improvements are to be made to the local electric light plant.

Milton, Pa.—The streets of this place will soon be lighted by electricity.

Chicago, Ill—The Morgan Park Electric Company has been incorporated to furnish electric light, power and heat. Capital stock, $25,000. G. S. Wheaton is one of the incorporators.

Davenport, Ia.—All the bids for public lighting in this city have been rejected and new ones will soon be wanted. Address Mayor Ficke, for particulars.

Electric Railways.—New electric railways are projected and improvements are to be made to those already established at the following places: Birmingham, Ala.; Lowell, Mass.; York, Ont.; Raleigh, Va; Lynchburg, Va.; Shenandoah, Pa.; Lancaster, Pa.; Lititz, Pa.; Lincoln, Neb.; Aurora, Ill.; Norwalk, Conn.

BIDS OPENED.

San Francisco, Cal.—Bids for the Preston Reform School have been opened as follows: Each bidder was required to make three separate bids, one for a stone front and sides, another for pressed brick and stone dressing, and another for common brick and stone dressing. The bidders and their bids were as follows: Richardson & Gale, $71,450, $63,950, and $62,200; B. Krenzberger, $73,692, $65,516 and $62,879; George D Nagle, $74,178, $67,770, and $66,010; J. H. Mackay, $74,890, $68,400, and $67,000; California Bridge Co., $88,172, $72,775, and $71,988.

GOVERNMENT WORK.

Scituate Harbor.—The following bids for dredging from Scituate Harbor, Mass., were received November 22: Boynton Bros., Boston, 34 cents per cubic yard; bowlders, $6; Bay State Dredging Co., Boston, 41c., $5, Metropolitan Dredging Co., Lynn, 40c., $6; New England Dredging Co., Boston, 34c., $5; Augustus R. Wright, Portland, 32½c., $5.

Plymouth Harbor.—The following bids for dredging from Plymouth Harbor, Mass., were received November 22: Metropolitan Dredging Co., Lynn, Mass., 33 cents per cubic yard; bowlders, $6; Augustus R. Wright, Portland, 29½c., $5; National Dredging Co., Wilmington, Del., 27c., $10.

Gloucester Harbor.—The following bids for dredging from Gloucester Harbor, Mass, were received November 22: National Dredging Co, Wilmington, Del., 23 cents per cubic yard; bowlders, $10: Augustus R. Wright, Portland, 28c., $8; Bay State Dredging Co., Boston, 22c., $8; New England Dredging Co., Boston, 27c., $5; Metropolitan Dredging Co., Lynn, Mass., 25c., $6.

Boston, Mass.—The following proposals for dredging the channels and harbors on the Massachusetts coast were opened November 21, by Col. S. M. Mansfield, Corps of Engineers, U. S. A.:

Weymouth River.—For dredging from Weymouth River 25,000 yards, more or less, of material, Augustus R. Wright, Portland, Me., 37½ cents per cubic yard; to remove bowlders over six tons in weight, $9 each. Boynton Brothers, Boston, 52 cents per cubic yard; to remove the big bowlders, $8. The Bay State Dredging Co., Boston, 55 cents per cubic yard, and $10 for removing bowlders. The Metropolitan Dredging Co., Lynn, Mass., 66 cents per cubic yard, big bowlders, $10.25.

Boston Harbor.—For dredging about 20,000 cubic yards of material from the channel leading to Nantasket Beach, Boston Harbor. Charles W. Lampee, Boston, 25 cents per cubic yard; to remove bowlders of over three tons, $10 each. Bovnton Brothers, Boston, to remove the material, 27 cents per cubic yard; bowlders, $6 each. A. R. Wright, Portland, 28½ cents for dredging, and $5 for removing bowlders. The Metropolitan Dredging Co., Lynn, 25¾ cents per cubic yard for dredging, and $10.25 for removing bowlders.

Salem Harbor.—For dredging of about 45,000 cubic feet of material in Salem Harbor: A. R. Wright, Portland, 22 cents per cubic yard; remove bowlders over three tons in weight, $5. The New England Dredging Company, Boston, remove material for 23 cents per cubic yard; remove the bowlders, $10 each. The Bay State Dredging Company, 25 cents for dredging, $10 for the removal of bowlders. The Metropolitan Dredging Company, 29¼ cents for dredging, $10.25 for removing bowlders. Messrs. Hamilton & Sawyer, Maine, 33 cents for dredging, $6 for removing bowlders.

Hingham Harbor.—For dredging of about 20,000 cubic yards from Hingham Harbor: A. R. Wright, Portland, 18 cents per cubic yard; to remove bowlders, $3 each. Boynton Bros., 25 cents for dredging, and $6 for removing bowlders. The Bay State Dredging Company, 52 cents for dredging, and $10 for removing bowlders.

Lynn Harbor.—For the removal of 40,000 cubic yards of material from Lynn Harbor: New England Dredging Company, Boston, 18 cents per cubic yard; to remove bowlders for $10. The Metropolitan Dredging Company, Lynn, 18¼ cents for removing the material, and $10.25 for removing bowlders. A. R. Wright, Portland, 18¾ cents; to remove bowlders, $5. The Bay State Dredging Company, 25 cents for dredging, and $10 for removing bowlders. The National Dredging Company, Wilmington, Del., made the same offer as the Bay State Dredging Company.

Winthrop Harbor.—For the removal of about 18,000 cubic feet of material from Winthrop Harbor: Boynton Bros, Boston, 24 cents per cubic yard; to remove bowlders, $6 each. The Metropolitan Dredging Co., Lynn, 28¼ cents per cubic yard; to remove bowlders, $10.25 each. Bay State Dredging Co., 28 cents per cubic yard; $10 for removing bowlders. A. R. Wright, Portland, 30 cents per cubic yard; will remove bowlders for $5 each. Hamilton & Sawyer, Maine, 30 cents per cubic yard; to remove bowlders, $6 each.

Newburyport Harbor.—For the delivery of rubble stone at the entrance of Newburyport Harbor: Joseph H. White, Boston, $1.47 per ton; Edward Canney, Pigeon Cove, Thomas A. Rowe, of Newton, each bid, $1.53 per ton; J. Cashman, of Newburyport, bid $1.69 per ton; G. W. Andrews, of Biddeford, Me., bid $1.82½ per ton, and the Rockport Granite Co. and Pigeon Hill Granite Co., of Rockport, each bid $1.95 per ton.

Harbor of Refuge.—Only one bid for the delivery of 225,000 tons, more or less, of rubble stone for the Harbor of Refuge, Sandy Bay, Cape Ann, was received, and that was from the Rockport Granite Co. and Pigeon Hill Granite Co., of Rockport, the bid being 73½ cents per ton. All proposals have been taken under advisement by Colonel Mansfield.

Washington, D. C.—The following bids for dredging in Potomac River, at Washington, D. C., were received by Peter C. Hains, 601 Eighteenth Street, N. W., November 25: Frank C. Somers, Camden, N. J., tidal reservoir, 200,000 cubic yards, 23 cents per cubic yard; John H. McNee, Washington, D. C., tidal reservoir, 15 cents and 16¼ cents per cubic yard; Washington Channel, 500,000 cubic yards, 15½ cents per cubic yard; Alabama Dredging and Jetty Co., Mobile, Ala., Channel, 14½ cents per cubic yard.

Milwaukee, Wis.—The following proposals for work on Wisconsin Harbors were opened on November 25, by Major Charles E. L. B. Davis, Corps of Engineers, U. S. A.

Manitowac Harbor.—Construction of pier superstructure. The figures are for the following items, in detail, in their order: 12x12 inch white pine timber, per m. feet, b. m.; 3x12 inch pine plank, per m.; stone, per cord; drift bolts, per pound; spikes, per pound, total, for 600 feet for cutting down and rebuilding superstructure, 20 feet wide and 6 feet high. Bidders: Truman Cooper, Manitowoc, Wis, $27, $19, $6; 3½ cents, 4 cents. Peter W. Galloway, Racine, Wis., $29.50, $22, $10.75, 4 cents, 5 cents.

Menominee River, Michigan and Wisconsin. Dredging 200,000 cubic yards: Truman & Cooper, Manitowoc, Wis., Section A, 10⅜c., Section B, 11⅜c.; S. O. Dixon, Racine, Wis., 20c., 23c.; Williams, Dougherty & Upham, Duluth, Minn., 23c., 23c.; Carkin, Stickney & Cram, Saginaw, Mich., 24c., 24c.; Green's Dredging Co., Chicago, Ill., 12¼c., 14½c.; White & Finch, Grand Haven, Mich., 12½c.; Christopher H. Starke, Milwaukee, Wis., 11½c., 11½c.; Knapp & Gillen, Racine, Wis., 14½c., 15c.; Green Bay Dredge and Pile Driver Co., Green Bay, Wis., 15¾c., 15¾c.

Mobile, Ala.—The following bids for dredging in Mobile Harbor, Miss., Biloxi Harbor, Miss., and Pascagoula River, Miss., were received by A. N. Damrell, Major of Engineers, U. S. A., November 20.

Mobile Harbor, Ala.—Anglo So. Construction Co., New York, N. Y., 16 cents per cubic yard for sand, 12 cents per cubic yard for clay; M. T. Fauria, Pensacola, Fla., 40 cents, $9\frac{4}{10}$ cents; Moore & Wright, Portland, Me., 18 cents, 11 cents; National Dredging Co., Wilmington, Del., 8⅜ cents for clay only; Alabama Dredging and Jetty Co., Mobile, Ala., 19 cents, 9 cents; George C. Fobes & Co., Baltimore, Md., 19 cents, 9 cents.

Pascagoula River, Miss—Alabama Dredging and Jetty Co., Mobile, Ala., 22 cents per cubic yard for compact clay and blue mud; George C. Fobes & Co., Baltimore, Md., 23 cents.

Biloxi Harbor, Miss.—George C. Fobes & Co., Baltimore, Md., 21 cents per cubic yard for blue mud mixed with sand; Alabama Dredging and Jetty Co., Mobile, Ala., 20 cents.

Boston Harbor, Mass.—The following bids for dredging in Boston Harbor, Mass., were received November 24: Bay State Dredging Co., Boston, 25 cents per cubic yard; bowlders, $8; Metropolitan Dredging Co., Lynn, 30c., $10; New England Dredging Co., Boston, 19¼c., $10; Augustus R. Wright, Portland, 21c., $8.

Brewster Spit.—The following bids for dredging from the west end of Brewster Spit, Boston Harbor, Mass., were received November 24: Bay State Dredging Co., Boston, 18 cents per cubic yard; bowlders, $5; Metropolitan Dredging Co., Lynn, Mass., 19c., $5; Boynton Brothers, Boston, 22c., $10; Augustus R. Wright, Portland, 14c., $4; New England Dredging Co., Boston, 21¾c., $5.

Manchester Harbor.—The following bids for dredging from Manchester Harbor, Mass., were received November 22: Robert Hamilton, Chebeague, Me., and Solomon Sawyer, Yarmouth, Me., 29 cents per cubic yard; bowlders, $6; Boynton Brothers, Boston, 33c., $6; Bay State Dredging Co., Boston, 32c., $8; Metropolitan Dredging Co., Lynn., Mass., 32c., $6; Augustus R. Wright, Portland, 23½c., $5.

INDUSTRIAL.

Pasadena, Cal.—The Palmdale Irrigation District (Los Angeles County) has issued bonds in the sum of $175,000 for the construction of two masonry dams and irrigation canals, to put 50,000 acres of land under cultivation The engineer is August Mayer, of Pasadena, Cal.

Pottstown, Pa.—A charter has been issued, incorporating the Pottstown Cold Storage and Warehouse Company, with a capital of $75,000.

Americus, Ga.—A stock company, with a capital of $20,000, is to establish a 70-ton ice factory at this place.

St. Louis, Mo.—The Missouri Dredging and Transportation Co. has filed articles of incorporation. The capital stock is $10,000. George F. Mincke, St. Louis, can furnish details.

Address, Andrew Rosewater, 422 Bee Building, Omaha, Neb.

PROPOSALS.

U. S. ENGINEER OFFICE. WILMINGTON, N. C., November 6, 1890.—Sealed proposals for **DREDGING** in the harbor at BEAUFORT, N. C.; Waterway between Beaufort Harbor and New River, N. C., and New River, N. C., will be received at this office until 12 M., December 16, 1890. The attention of bidders is specially invited to Acts of Congress approved 26th of February, 1885, and 23d February, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes-at-Large. All information furnished by W. H. BIXBY, Capt of Engineers. 1

PROPOSALS.

NOTICE TO CONTRACTORS.

Sewer Pipe.

TENDERS WILL BE RECEIVED BY REGISTERED post, addressed to the City Engineer, TORONTO, up till noon on TUESDAY, 2d December, for supply of pipe for year ending 31st December, 1891.

APPROXIMATE QUANTITY REQUIRED.

PIPE.

6-inch pipe	35,000 feet.
6-inch bends	200
9-inch pipe	5,000 feet.
9-inch bends	100
12-inch pipe	12,000 feet.
12x6-inch junctions	800
12x9-inch junctions	200
15-inch pipe	3,000 feet.
15x6-inch junctions	200
15x9-inch junctions	100
18-inch pipe	500 feet.
18x6-inch junctions	20
18x9-inch junctions	40
1 foot 2 inches x 1 foot 9 inches tile invert	2,000 feet.
2x3-foot tile invert	3,000 feet.
6-inch stoppers	800
9-inch stoppers	200

Specifications and forms of tender can be obtained on and after the 1st of December at the City Engineer's office.

A deposit in the form of a marked check, payable to the order of the City Treasurer, for the sum of 2½ per cent., on the value of the work tendered for, must accompany each and every tender, otherwise it will not be obtained. All tenders must bear the *bona fide* signatures of the contractor and his sureties (see specifications), or they will be ruled out as informal.

The committee do not bind themselves to accept the lowest or any tender.

JOHN SHAW,
Chairman, Committee on Works.
Committee Room, Toronto, Can.,

To Builders of Pumping Engines.

SEALED PROPOSALS, INDORSED "PROPOSALS for Pumping Engine," will be received at the office of the Lowell Water-Works, City Hall, Lowell, Mass., until 2 P. M. on FRIDAY, January 16, 1891, for the construction, delivery and erection of a ten-million gallon steam **PUMPING ENGINE** for the City of Lowell, Mass., and at that time will be publicly opened and read.

Specifications will be mailed upon application to Water-Works Office, City Hall, Lowell Mass.

Other information may be obtained upon application to Lowell Water-Works Office, or from GEORGE M. BARRUS, M. E., 95 Milk Street, Boston, Mass.

JOHN STOTT,
MILES F. BRENNAN.
EDWARD W. THOMAS,
Committee on New Engine of
Lowell Water Board.

LOWELL, MASS., November 24, 1890.

UNITED STATES ENGINEER OFFICE, 34 West Congress Street, Detroit, Mich., November 28, 1890.—Sealed proposals, in triplicate, for furnishing all **MATERIALS AND LABOR** and building the masonry of a lock at ST. MARY'S FALLS CANAL, MICH., will be received at this office until 2 o'clock P. M., January 27, 1891, and then publicly opened. Preference will be given to materials of domestic production or manufacture, conditions of quality and price (import duties included), being equal. Attention is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol 24, page 414, Statutes at Large. The Government reserves the right to reject any or all proposals; also to award the contract upon other considerations than the price. For further information apply at this office, or to the U. S. Engineer Office, Sault Ste. Marie, Mich. O. M. POE, Colonel, Corps of Engineers, Bvt. Brig.-Gen., U. S. A. 5

PROPOSALS.

PROPOSALS FOR VERTICAL PUMPS.

SEALED PROPOSALS WILL BE RECEIVED at the office of the Board of City Affairs, CINCINNATI, O., until 12 o'clock noon of December 26, A. D. 1890.

For four **VERTICAL PUMPS**, of five million capacity each, in twenty-four hours. These pumps to take the place of similar size Wetherill pumps now in position, and to operate by the steam ends now in use. Each bidder is requested to examine and measure the well, and so design his work as to properly connect with the parts to be retained.

Each bidder will be allowed to furnish his own plan, drawings and specifications, with guarantee as to date of completion, and forfeiture for failure in time. Also, will be required to give proposition on plans and specifications furnished by the Board of City Affairs.

For particulars apply to Willis P. Tharp, Superintendent and Engineer of Cincinnati Water-Works.

The Board of City Affairs reserves the right to reject any or all bids.

By order of the Board of City Affairs.
THOS. G. SMITH,
President.
Attest: D. W. BROWN, Clerk B. C. A. 3

NOTICE TO CONTRACTORS.

TENDERS WILL BE RECEIVED UP TO 4 o'clock P. M. on the 17th of December next, at the office of the undersigned, for the Construction of **SEWERS** for the Corporation of the City of Victoria, B. C.

For particulars of plans and specifications apply at the City Hall, Victoria, on or after the 15th day of November next ensuing.

Five per centum of the approximate amount of the work tendered for will be required to be deposited with a tender to insure its consideration This may be done either in Cash or by Certified Cheque on some bank in British Columbia. All Cash or Certified Cheques to be returned to unsuccessful tenderers.

Estimated cost of sewers, $300,000.

The lowest of any tender not necessarily accepted.

By order
WELLINGTON J. DOWLER,
City Clerk's Office, C. M. C.
Victoria, B. C., Sep. 26, 1890. 26

ELECTRIC LIGHTING.—Proposals are wanted until December 19, 1890, for lighting, by electricity and gas, the public streets, etc., of FRANKFORT, INDIANA, for a period of five years. Address S. A. COOK, City Clerk.

PROPOSALS FOR DREDGING.—U. S. Engineer Office, Cleveland, Ohio, November 10, 1890.—Sealed proposals, in duplicate, will be received at this office until 12 o'clock M., on TUESDAY, the 2d day of December 1890, when they will be opened in the presence of bidders, for **EXCAVATING** 925,000 cubic yards, more or less, of material from Maumee River and from Maumee Bay along line of proposed straight channel for TOLEDO HARBOR, OHIO. Preference will be given to materials and plant of domestic production or manufacture, conditions of quality and price (import duties included) being equal. The attention of bidders is invited to Acts of Congress approved February 26, 1885, and February 23, 1887, Vol. 23, page 332, and Vol. 24, page 414, Statutes at Large. All information can be obtained at this office. The United States reserves the right to reject any or all proposals. L. COOPER OVERMAN, Major of Engineers. 26

CEMENT.

CITY ENGINEER'S OFFICE,
CITY HALL.
Providence, R. I., March 12, 1886.

Abstract from letter of SAMUEL M. GRAY, *City Engineer*.

"During the season of 1885 the Sewer Department used 3,152 *Barrels* of the *New York and Rosendale Cement*, Of this amount 1,348 barrels were tested for tensile strength, the average of the season's tests being 165.7 pounds per square inch, twenty-four hours' test. One hundred and forty-five barrels were tested for fineness, the average amount passing through a 2,500-mesh sieve being 92.56 per cent. Test for checking were occasionally made, but none were discovered.

OVER 100,000 BARRELS OF OUR CEMENT USED ON THE NEW YORK & BROOKLYN BRIDGE.

"Giant" Portland Cement,
"Union" Hydraulic Cement.
Send for Circulars, Certificates of Tests.

SOME PRESS COMMENTS:

A most creditable and seasonable compilation. It is decidedly the best collection of data on this important subject that has yet appeared in book form.—*Engineering News, June* 21, 1890.

* * * It should have a place, especially, in the offices of street and county commissioners, where its suggestions might soon contribute greatly to the commercial welfare, safety and convenience of thousands of communities in our land.—*Iron Age, June* 19, 1890.

The volume is one which has a practical value, and should be studied by all interested in road improvements.—*Troy Times, July* 21, 1890.

A valuable manual.—*San Francisco Chronicle, July* 13, 1890.

If all the knowledge to be obtained in this book could be intelligently applied, what an immense change for the better would be apparent throughout the whole country.—*Cincinnati Commercial-Gazette, June* 9, 1890.

ASPHALT PAVEMENT.

GENUINE TRINIDAD ASPHALT
THE STANDARD PAVEMENT OF AMERICA.
OVER 4,000,000 SQ. YDS. OR 260 LINEAL MILES IN USE

1st. It will save 50 to 75 per cent. of the cost of transporting passengers and goods in any city. 2d. It will save 50 to 75 per cent. of repairs to vehicles. 3d. It saves human nerves. 4th. It saves human lives. It is worth more than it costs, and it costs less than any other standard pavement.

This pavement has now been in use in various cities of the United States for a period of twelve years, and its desirability as a road covering is established beyond question. More than 2,500,000 square yards, or 165 lineal miles, have been laid by this Company in the cities of Washington, Philadelphia, Boston, Buffalo, Erie, Scranton, Wilkes Barre, Youngstown, Chicago, Omaha, St. Joseph, St. Louis, Louisville and New Orleans. We invite an inspection of any or all of this work by city authorities or others contemplating paving.

HOLYOKE.

WHAT THEY SAY ABOUT IT.—"We have 80 of your Hydrants in use and prefer them to any other kind we have tried. We have had no trouble with them of any kind, and consider their principal advantages to be:—1st. A large and unobstructed water-way. 2d. The ease with which they can be opened even under our heaviest pressure of 115 lbs. per square inch. 3d. *The fact that we have never known one of them to freeze or need any repairs whatever.*"—CHIEF ENGINEER, FALL RIVER WATER WORKS.

TECHNICAL BOOKS.

ASIDE from our own publications the Book Department has for several years made a specialty of supplying all the latest technical books, particularly those in which the readers of this journal are especially interested.

Orders will be promptly filled, postage free, on receipt of published price.

ADDRESS, BOOK DEPARTMENT,
THE ENGINEERING & BUILDING RECORD,
277 PEARL STREET, NEW YORK.
P. O. Box 3037.

POSITIONS VACANT.

Advertisements will be inserted free under this heading for any of our readers who desire professional, commercial or mechanical employees in any occupation kindred to the scope of this journal. Answers can be addressed to the care of *The Engineering & Building Record.*

Advertisers will secure better results by publishing their real name; good men hesitate to apply for positions to an anonymous advertiser, especially if they are still employed but desire to change.

MECHANICAL.

WANTED. — A FOREMAN FOR STREET work, must be a good calker and come well recommended. To a sober, industrious man this position will be permanent. Address, giving qualifications and stating wages wanted, C. F. WOOD, Superintendent Knoxville Water-Works, Knoxville, Tenn

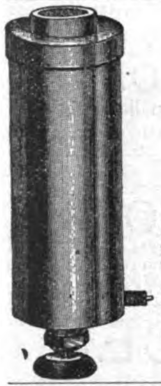
THE STAR WATER-TUBE BOILER.
(Lindemuth's Patent.)
For Steam, Hot Water Heating and Power.

IS A WATER TUBE, FIRE-BOX BOILER; HAS WIDE PENDANT CAST IRON BASE, FULL LENGTH; IS PORTABLE; AND REQUIRES NO BRICK SETTING. ACCESS IS GIVEN TO CLEAN EVERY PART.

HARRISBURG BOILER & M'F'G CO.,
HARRISBURG, PA.
New York Office, 92 CENTRE STREET.



DIMMICK AIR MOISTENER,
MANUFACTURED BY
THE PHILADELPHIA EXHAUST VENTILATOR CO.,
520 Commerce Street, Philadelphia, Pa.

This AIR MOISTENER is attached to radiator in place of air valve. It may also be attached to steam pipe. It allows steam in shape of moisture to escape into the atmosphere, which produces a moist feeling, beneficial to health and furniture, and entirely obviates the dry sensation produced by direct radiation. The moisture may be passed through any desired aromatic substance, and escaping through the perforated metal cap at the top imparts the odor to the atmosphere.

Send for Circular.

THE PLAXTON HOT WATER HEATER

EASILY CLEANED. EASILY MANAGED. EASILY SET UP.

BUFFALO, N. Y., July 10, 1890.

EUREKA STEAM HEATING CO., ROCHESTE , N. Y.

Gentlemen: Mr. C. K. Summerhays put one of your Plaxton Hot Water Heaters in my store last fall, and to say that I am well pleased with it is putting it very mild. I use natural gas for fuel, and it costs me $7.00 a month during the winter for my stores 30 x 45. During the warm weather there is no trouble in keeping the temperature down to 65 or 70, or keeping it up to that point in cold weather. The heat is all that could be desired, not like furnace heat, dry, and the kind that gives you a headache. I am,

Yours truly, ELI. T. HOSMER.

Send for New Catalogue C. X.

50 & 52 *North Seventh Street,*
PHILADELPHIA.

THE "A-D"
Syphon Water-Closet.

IMPORTANT FEATURES.

WE wish to call particular attention to the fact, that the Water Supply to Closet passes through a curved passage so that it is thoroughly trapped to the depth of about six inches, which insures positive protection from any escape of foul air. The result being, that this is the only **double trap Syphon Water-Closet** that positively prevents the foul air contained between the two traps from escaping into the room.

A feature is the manner of venting the soil pipe on either right or left side, in such a manner and to such an extent that it is impossible to clog the vents and impossible to even partially empty the lower trap.

Unlike other double trapped Syphon Closets we do not depend entirely upon the seal in lower trap.

The "A-D" is perfectly safe if lower trap was empty, though in consequence of perfect vents this cannot occur.

PAVEMENTS AND ROADS;

THEIR

CONSTRUCTION AND MAINTENANCE.

REPRINTED FROM

THE ENGINEERING AND BUILDING RECORD.

COMPILED BY E G. LOVE, PH. D.

PREFACE.

THIS book is a compilation of articles which have appeared in recent volumes of *The Engineering and Building Record*, edited with a view of eliminating whatever was of timely or local interest, and arranged by divisions for convenience of use.

The science of paving and the need of proper maintenance of pavements is yet comparatively little understood in this country, and the same is true in even greater degree with regard to roads. The editor of the journal named was led to give the matter special attention by seeing what was done in Europe, during his visits there, and finally began an investigation of work on streets and roads in England, France and other countries, the result of which was the gathering of a large and very valuable mass of information in regard to the subject. Of this everything likely to be of practical use in America was printed in *The Engineering and Building Record*, and is given here in more convenient shape. With it appears a large quantity of matter from American sources, including the prize essays on Road Construction and Maintenance submitted in the competition instituted by the journal named in December, 1889.

It will be seen that the great bulk of the book is made up of records of experience and statements of cost in different places. The comments are based on this experience.

TABLE OF CONTENTS.

PART I.

CHAPTER I.—STONE PAVEMENTS.
Construction of, in Liverpool—Paving Inspection—Specifications in New York—Violation of Specifications—Paving Material.

CHAPTER II.—WOOD PAVEMENTS.
Construction of, in London—Cost and Durability—Specifications for Materials—Wood Pavements in Paris and other Cities—Sanitary Aspects—Necessity of Maintenance.

CHAPTER III.—ASPHALT PAVEMENTS.
Nature and Uses of Asphalt—Pavements in the United States, Paris and Berlin—Cost and Maintenance of in London and Liverpool—Renewals—Injury by Gas—Slipperiness—Affecting the Value of Property.

CHAPTER IV.—BRICK PAVEMENTS.
Clays, and the Manufacture of Paving Brick—Crushing Strength—Use in American Cities—Construction and Durability—Specifications—Miscellaneous Road Metaling Material.

CHAPTER V.—CURBS, SIDEWALKS AND TRAMWAYS.
Artificial Stone for Curbs—Footpaths in England—Asphalt and Concrete for Footpaths—Liverpool Tramways.

CHAPTER VI.—STREET OPENING—MAINTENANCE.
Liverpool Excavation Contract—Opening and Reinstating Pavements—Requirements in New York—Maintenance of Pavements in London—Cleaning London Pavements.

CHAPTER VII.—NOTES.
Experience with Various Pavements in London—Traffic in Paris and in American Cities—Iron Wheelways—Effect on Health of Noisy Pavements—Tests of Durability—Contracts Guaranteed.

PART II.

ROADS: CONSTRUCTION AND MAINTENANCE.
Repair and Maintenance—Common Roads in France—Road Making—Improving Country Roads—Specifications—Legislation—Macadam Roads—Herschell's Treatise on Road Making—Methods of Superintending Construction and Repairs.

PART III.

PRIZE ESSAYS ON ROAD CONSTRUCTION AND MAINTENANCE, submitted in the Competition instituted by *The Engineering and Building Record.*
Report of Committee of Award.
Abstracts of Essays receiving Honorable Mention.
A Plea for Æsthetic Considerations in Road Making.
Comments on the Prize Essays by the Committee of Award.

Sent Post-paid on receipt of Price.
